The hardwood forests of the United States are practically exhausted of mature timber; the lumber interests are even now stripping them of their second growth, which will also be exhausted, at the present rate of consumption, within a comparatively few years. From this emergency there is but one way of escape, and that is to plant freely of the Australian eucalyptus, the most durable and rapid growing genus of forest trees in the world.

This is not said to give any force to the fabulous claims of the fake eucalyptus concerns promoted so fiercely a few months ago, and which only injured an industry of great promise. Within proper bounds the extended planting should be encouraged. To that end field planting hints are in order, as within the next few weeks the young tree should be put into its permanent location.

Planting Out in the Field.

The land should be plowed as deeply as possible and well harrowed. The time to plant varies according to the climatic conditions. In localities where there is little or no frost, planting may be done in the winter time, thus getting the benefit of the rains, but in sections where frost prevails, planting should be deferred until spring. The size at which the plants are best to set out is from six to ten inches. The boxes may be taken to the field and left at convenient points. One side of the box should be taken off, and each plant cut out with a square of earth and then planted with a trowel, taking care not to break this ball of earth, and the plants should be set about one inch deeper than they were in the box. A quart or so of water should be given to each plant as soon as it is set, and afterwards hoe a little dry soil up around each plant. The distance at which to set the young plants varies according to the species planted, the soil and the purpose for which they are grown. On heavy soils where irrigation is not practiced they may be planted 6x6 feet apart; where irrigation and cultivation are practiced, 4x8 feet is a suitable distance and leaves an eight-foot space for plowing and irrigating. On lighter soils 8x8 feet is a good distance. Some are planting 7x8 feet on the alternate or triangle system, placing the trees eight feet apart in the rows and seven feet between the rows, which makes the trees eight feet apart every way. It is claimed for this system that they do not throw so much shadow and get a more even amount of sunlight, causing the trees to make a straighter and more even growth when young.

Care of the Young Trees.

As the value of the grove depends largely upon the trees making a good start, it will pay wherever practical to irrigate and cultivate the trees for at least the first two seasons.

Thinning the Trees.

To produce good lumber it is necessary that the trees grow straight. Close planting induces a straight growth. It is therefore better to plant closely and at the end of the first season grub out all weak and inferior trees.

Species to Plant for Profit.

In localities where the E. globulus, "blue gum," thrives, there is probably more money to be made, and quicker returns, by planting this species than any other. For the hot interior sections, E. rostrata and E. tereticornis are recognized as the leading commercial kinds. In localities not subject to frost, E. corynocalyx may be planted. For those who have the right conditions and can afford to wait longer for returns, E. resinifera will probably prove one of the most profitable on account of its very valuable wood, which is used for furniture and interior finishing, and is imported very largely by railway companies for the inside of cars under the trade name of Australian mahogany.

20th Century Grader

The Light Weight Wonder

600 Pounds

—masters the most difficult pieces of land—cuts the brush—stirs the soil so it won't need ploughing—levels the land—throws up dikes—digs ditches and maintains your roads.

This grader is invaluable on fruit farms. One man—one team—operates it. The 20th Century is

The Original One-Man Machine

It is all steel and will last through years of hard service.

It does the work of several special machines and adds to your profits.

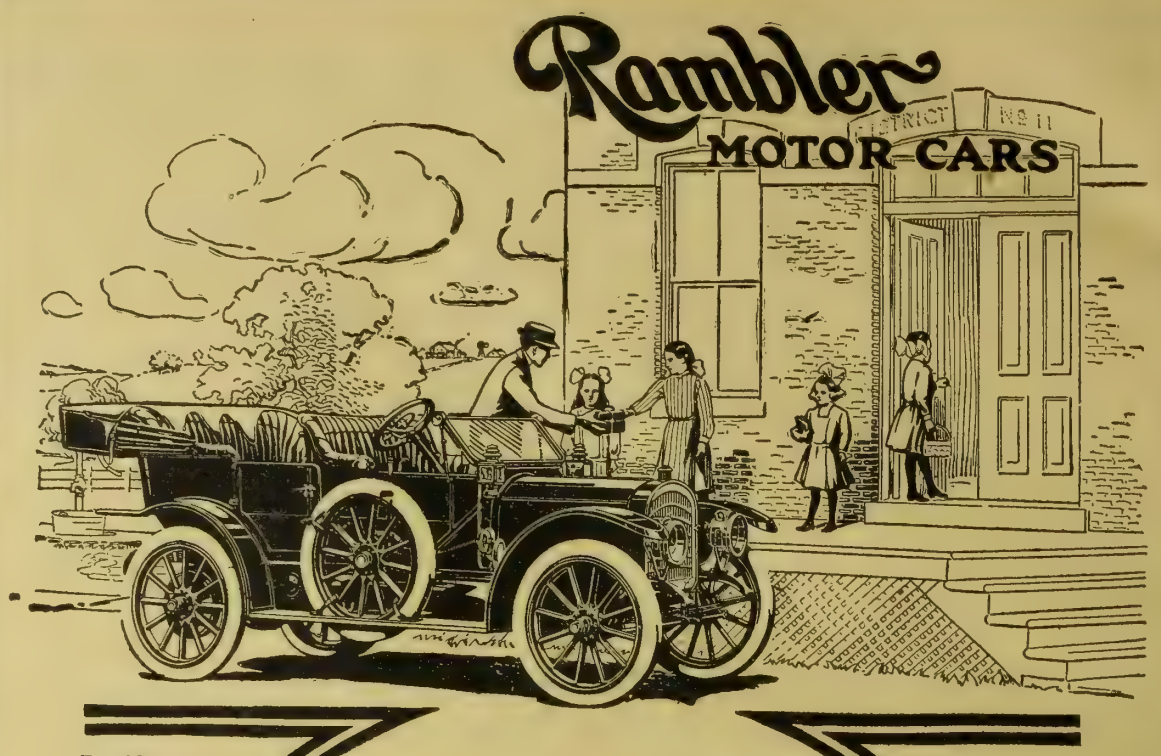
Rambler MOTOR CARS



Rambler
Sixty-three

THE Rambler brings the schoolhouse within easy reach of the children and places the market, the church, the theater and the library within the distance of a brief and pleasant ride. The only American car equipped with the Spare Wheel. No tiresome pumping in the hot sun or cold rain, and you avoid the dirt so disagreeable to the well-groomed. These things for comfort—big wheels and tires, long wheel base, shock absorbers, and upholstering like that of the finest club furniture. These things for safety—brakes so large that you always feel secure; safety starting device to protect you from injury while cranking. These things for efficiency—offset crank shaft and straight line drive enable you to glide along slowly and quietly behind a loaded wagon and take the hills and deep sand without rushing. These features are essential in a car for use on country roads. Experience will prove that they are not mere talking points.

Get a copy of the Farm Owners' Number of the Rambler Magazine at once. It is the most interesting book ever issued on motor cars for farmers. A postal will bring you a free copy.

Fructification of the Fig by the Blastophaga

An Address by G. P. Rixford, Bureau of Plant Industry, United States Department Agriculture, Before a Meeting of the Pacific Association of Scientifiic Societies at Berkeley March 31.

The subject of this paper is both botanical and entomological, and to make it clear it is necessary to mention some of the botanical characteristics of the fig.

Botanists are now generally agreed in the acceptance of the ideas of Linneus and others that the caprifig is the staminate form, and the Smyrna and all the common figs in cultivation the pistillate form of a dioecious species. Hegardt reached this conclusion as early as 1844, and this view is now generally accepted.

The fruit of the fig tree is not a fruit in the sense in which we regard the apple, peach, etc., but is what is known to botanists as a receptacle upon the inner surface of which are arranged hundreds of unisexual flowers. At the apex of the receptacle is an opening which in the young fruit is closed by a number of scales or imbricated bracts. The blossoms of the fig tree are therefore never seen except by opening the fig. The flowers thus being effectually cut off from the outer world, there is no way by which the pollen from the male flowers can reach the female flowers, except by the assistance of some outside agency. In this case the medium of conveyance is the female Blastophaga grossorum.

Crops of the Fig Tree.

All the female fig trees, both of the Smyrna class, the fruit of which never matures without pollination, and the other large class which does not require pollination, have two well defined crops. The first pushes from the old wood and is the first to appear in spring, ripening in July and August, in the south of Europe called brebas, figues fleurs or figues d'ete. The next, which is the main crop, called in France figues d'automne, spring from the axils of the leaves of the new wood and ripen in summer and fall.

The crops of the male or capri tree are two well defined, and a third which is in doubt by some authorities. To these, for convenience, the Neapolitan names, mamme, profichi and mammoni, have been applied. The first or mamme crop forms in late summer on the wood of the current season, and the blastophaga from the preceding mammoni oviposits in them when they have reached the size of filberts. By December these are the size of small walnuts, and change but little during winter. The insect hibernates in them in the larval condition, and will endure a temperature of about twenty degrees without injury. As the weather becomes warm in spring the wasps develop rapidly, and in April are ready to issue. At this time the spring or profichi crop on the same or other capri trees is in a receptive condition. This crop grows in clusters on the old wood, at the extreme ends of the branches, and, unlike the mamme, which is nearly spherical, is much larger, and usually has a pronounced neck. It is produced in enormous numbers—many times greater than any other crop—a wise provision of nature, as it is the one which is most abundantly supplied with pollen, and also the one which is exclusively used to pollinate the main Smyrna fig crop.

The third or summer crop of the capri tree, known as mammoni, unlike the others, pushes from the axils of the leaves on the new wood, and matures from September to the middle of November. The only purpose of this crop seems to be to carry the blastophaga through the late summer and fall months and to produce seed. Dr. L. O. Howard, chief of the Bureau of Entomology of the United States Department of Agriculture, has doubts as to the existence of three distinct crops of caprifigs, and with good reason, for at times and in some climates belated mammoni hibernate with the mamme. The chief difference between the two is that the former contains a well-defined cluster of staminate flowers, while in the mamme no male flowers have been observed. These hibernating figs are so similar in form and general appearance that without cutting them open it is difficult to tell them apart. They can be found on some capri trees at the present time. Last Saturday the writer, in company with Prof. Harper, found considerable numbers of them on a tree at Niles. When their habits are better known they may prove to be an important source of pollen for the early crops of Smyrna and other breba figs, which often fail to develop. The blastophaga oviposits in the winter crop, and thus the cycle of the yearly life of the insect is completed.

The Fig Flowers.

Count Solms-Laubach and Dr. Meyer, the German botanists; Olivier, the Frenchman, and Gasparini, Gallisio and Pontedera, the Italians, and later Dr. Gustav Eisen, author of the leading treatises on the fig in the English language, are all agreed that there are four kinds of flowers in the fig. It may seem presumptuous to take exception to this array of distinguished authorities, but it is nevertheless a fact, easily demonstrable with the abundant material now accessible in California, that there are but two kinds of fig flowers, namely, pistillate and staminate. These authors enumerate the four kinds as the male and female of the caprifig, the regular female flower of the Smyrna fig, and, lastly, the female flowers of the Adriatic class, which some of them contend have imperfect stigmas and cannot be pollinated, and are therefore called mule flowers. Pontedero and Gallesio call such flowers fico mula and fico semi-mula, the latter, a few of which are susceptible of pollination, and the former not at all. This idea has become so fixed in the minds of some horticulturists that they are calling this class of figs "mule figs," a positive misnomer and entirely unwarranted by the facts.

The staminate flowers of the caprifig are arranged in a zone or cluster at the upper part of the fig, just within the eye. The remainder of the receptacle is filled with gall flowers, which are nothing more than female flowers, the pistils of which are modified for the purposes of the female blastophaga. The styles of these flowers are short and thick compared to those of the Smyrna and other female figs, and are provided with a duct down which the female wasp pushes her ovipositor into the ovary where she deposits the egg. These styles are surmounted usually by forked stigmas, the surfaces of which are provided with the usual cells or glands and the viscous coating to which the pollen grains adhere. With sufficient magnifying power the pollen tubes can be seen pushing their way from the surface down through the cellular tissue into the ovary. The gall flowers of all caprifigs are alike, except for slight variations in the shape of the stigmas.

We now come to the regular female flower of the Smyrna fig, upon the character of which all are agreed. The style is long and slim, two or three times longer than the style of the caprifig, and this is the reason that it is unsuited for the purpose of the insect. It is divided at the summit usually into two stigmas, and they appear to be identical with those of the Adriatic class, to which belong all those figs which reach an edible condition without pollination. The stigmas of the latter, the books say, are mostly malformed and cannot be fertilized.

To show how erroneous is this conclusion, it may be mentioned that during the spring of 1909 the writer, by applying the blastophaga to the so-called "mule figs" in more than forty cases, found that in every instance heavy fertile seeds were produced, and, in as large proportion as in the Smyrna fig, from these seeds thou-

(Continued on Page 439.)

Olive Culture from Nursery to Bearing

Written for the Cultivator by Mrs. M. E. Sherman.

In this morning's paper I find the following item in regard to olives:

"The olive is another fruit for which the soil and climate of Fresno county is ideal. The trees require almost no care and yield with amazing profusion. An acre will produce two or three tons of the varieties suitable for picking, and bring from $80 to $100 a ton. The smaller varieties, used for making olive oil, yield three and a half to five tons per acre, worth from $40 to $50 a ton. The average cost of cultivation is $20 per acre. The average crop of Fresno county is about three hundred and fifty tons, but the industry is advancing very rapidly."

Paragraphs like this have much to do with the failure of the olive orchards. The interior valleys are ideal for the olive at present as we do not have the black scale to contend with, but it is to be remembered that careless cultivation of any fruit will give its enemies a chance to increase. The sun is the great foe of black scale, and unpruned olive trees means interiors that escape the benefit of a sun bath. Unpruned olive trees therefore are an invitation to scale to move in and occupy the tree. The fact that an olive tree will endure great hardships and still live is not valuable at all to the commercial orchardist. The tree must fruit well to be profitable and unless it has good soil, abundant water and fertilizers when needed, it will not produce a paying crop. Size in the olive berry is also desirable as the fruit is bought under grades, oil olives, or the smaller sizes, selling for $45 a ton, while number one, pickling olives, sell at $100. The average crop runs a little over three tons to the acre with us, and twice we have gone over four tons to the acre. As the trees are young for an olive orchard (20 years) the crop may reasonably be expected to increase up to say five tons to the acre in favorable seasons.

Varieties.

When it comes to recommending the best varieties to plant the problem is an unsolved one as yet. We have in the state in bearing olive orchards the following: 80 per cent Mission, ten per cent Manzanillo and the rest mixed olives. In the Mission olive tree there seems to be three strains in the state. We do not know if these are accidental differences or if they are really different olives. The large Mission is the one desirable for planting. The Manzanillo is a little larger olive and ripens a couple of weeks in advance of the Mission, which is a distinct advantage in Fresno county, as it escapes nipping if the early frosts come in November. While light frost does not injure the olive for oil, it does sometimes affect the texture enough to make it grow soft in pickling. The two last seasons a few olives of the Manzanillos have been brought to me to examine for dry rot. They certainly showed it in the larger specimens. If this continues they will not be desirable. The Sevillano, or Queen olive of Spain, rots at the pit and for that reason the Spaniards always

CITRUS Trees

Buy and Plant Citrus Trees NOW

We have a magnificent stock of the best varieties still on hand and are prepared to fill orders for almost any quantity.

ORANGES

As a revenue producer, where conditions are favorable for its development, one year after another, we know of no more profitable variety than

THE VALENCIA LATE

On account of its coming on the market in the late spring and early summer months and the further fact of its being an acid fruit, makes it sell nicely in connection with deciduous fruits.
VALENCIA LATE ORANGES have sold at higher prices than any other oranges and in favorable localities where there is no danger of the fruit getting frozen, the Valencia is sure to be a money winner on account of its increasing strong demand. It is a vigorous grower and prolific bearer. Actual returns from producing orchards show more net profit per acre than from any other orange grown. We have a fine stock of 2-year-old trees and can fill your orders for these trees as well as the WASHINGTON NAVEL in almost any quantity.

pickle it green. We have no market for green olives, so it will hardly pay to plant of this variety very heavily as it is not good for oil if rotted. The Ascolano is another candidate for favor, but it has poor color when ripe, and the market pays highest for a black pickled olive. There are a large number of other kinds of olives, but as they are not planted in any quantity it will hardly pay to go further into the discussion of varieties. The only other two that have any prominence at present are the Nevadillo Blanco and Oblitza. The Nevadillo is not fruiting well and as it blooms freely may prove to require another variety to be planted with it as a pollinator. The Oblitza does not have enough increased size over the Mission to make it worth while to plant many and its inferior color when pickled is greatly against it. The ordinary Missions run about 110 to the pound while the Oblitza runs 105. Well-grown Mission olives when the trees receive summer irrigation will run larger than this. The Pendulina is a small olive of high flavor and it pays to have a few trees scattered through a Mission orchard as it adds greatly to the bouquet and flavor of oil.

Planting.

At present the money is in the pickles, but with the increasing reaching out of the women for knowledge in household economics the use of olive oil should increase yearly. The olive trees when first planted out should be given ample distance apart, as the trees are expensive and will need much more room when twenty-four years old than twenty feet by twenty. I have given them room from the first and planted a row of peach trees between the olives. This puts the olive trees forty-four feet apart with peach trees alternating in the rows and a row of peaches between rows of olives. The peach orchard acts as a wind break in a little while to protect the olive trees. The peach trees bear enough from the fourth year to make the orchard profitable. The olive trees bore six tons on thirty acres the fourth year and have never failed since. The cultivation of the olive is the same as for any other orchard and it should be watered twice in the summer, if possible, certainly once if large fruit is desired. This second watering should come as late as possible in the season, August, if possible. I am about to put in a well for this purpose as the ditch water is often too low to reach the land rapidly enough for economical handling.

Pruning.

The olive must be kept low-headed as the expense of picking is greatly lessened. This season the Japanese picked the home orchard for $13.50 a ton and made about three dollars a day for each man employed. A small crop that was sent in by a tenant was also picked and this cost nearly $20 a ton, and the Japanese would have refused to do it except that it was only a small amount of olives and the crop was ninety-six tons. The tree is headed down low at first and then regularly pruned by cutting back the top sharply; it is also well thinned out in the center. The tree bears its fruit on last year's wood, so that good pruning consists in leaving enough wood to bear next season and not enough to overbear, as that would mean a crop only every other year. The inside pruning of the olive and the cutting back of the bearing tree is nearer like the pruning of the peach than any other tree. If the pruning is too severe in either of these trees an excessive wood growth takes place and little fruit is produced. The trees must not be allowed to have long naked limbs with a tuft at the top, but must be kept in round balls and as they increase in size it must be in circumference, not height.

Propagation.

At present the nurserymen are rather disposed to grow Picholine seed and then bud the seedling with other varieties. I regard this as objectionable because of the care required in watching that the root does not sucker and take the place of the top. The olive trees that we hear about as a thousand years old have grown by renewing themselves from the roots. There are two ways used to start the olive from cuttings. The nursery way is the use of small tip cuttings. The small green wood must be just at the hardening stage, but not quite hardened as yet. The cuttings are made about four inches long and two sets of leaves are left at the top. They are placed in sand beds and bottom heat used to induce rooting. The home grower without glass or bottom heat often has good success by using flats to put the cuttings in and standing these in a regular hot bed, using canvas for covering. The regular way of growing the olive is to use ten-inch cuttings made of mature wood, hardened, of a thickness from lead pencil size up to that of an inch and a half. These cuttings are planted in the nursery rows and root readily if sufficient moisture is supplied all summer long. Those that do not come along well the first year will grow into trees the second year. This is the best way to grow them into healthy trees for California conditions. The true Italian way is to cut any sized wood up to great trunks into cord wood lengths and bury them six inches under moist soil. When the shoots show they are chiseled off and planted out as regular cuttings with a good-sized piece of the trunk at the roots. These rarely fail to make fine growth the first season.

Budding and Grafting.

The olive buds take readily when the dormant bud is used. These are found at the base of the short twigs on the inside of the trees. The bud is taken off with the regular shield shape bit of bark with a little wood left in to support it. The twig is taken with it and the bud with the twig is slipped into the tree bark by using the regular T-shaped cut. It is tied in place and watched carefully, When it has united the string is removed and the end of the limb cut a little back to start it to growing. As soon as strong enough it may be allowed to take the place of the original limb or trunk. Grafting of the larger tree trunks is sometimes done but it is more difficult to keep the tree from sunburning. The olive tree often dies if much burnt and seems particularly sensitive to having more than a third of the top removed at one time. The scions are cut the thickness of a lead pencil and the end is cut obliquely about an inch and half long. The bark of the parent tree is split and the oblique end of the scion tied into place under the bark which is then waxed. If the trunk is over two inches thick, then two scions should be used. In making cuttings or scions from the olive use the top or bearing wood, as sucker wood is very much slower in coming into bearing. The Italians give this as their experience and it is certainly true where one does not grow his own

trees that some of the trees will be in full bearing at six years old and others will not fruit until from seventeen to twenty years old. As the care is the same there must be some other cause for this difference. The only explanation offered has been the difference in character of the wood from which the original cutting was made.

THE RELATION OF BLACK ROT TO BLUE MOULD DECAY IN ORANGES.

From Citrus Protective League Circular.

Nearly twenty years ago Mr. N. B. Pierce, of Santa Ana, who was then connected with the United States Department of Agriculture, investigated the nature of black rot in oranges. This disease is unusually severe this season. It is caused by a fungus belonging to the genus Macrosporium. Mr. Pierce found that this fungus gains entrance to the fruit through splits and imperfections in the navel while the fruit is immature and hanging on the tree. The injuries to the navel which appear to be caused by the conditions of growth may be too small to be seen with the naked eye, and may not occur in the exposed parts of the navel. Mr. Pierce found that these spores or seeds of black rot, like those of blue mold, cannot enter the healthy, unbroken skin of the fruit. It is probable that it gains entrance to the orange in the fall, when it is immature, and that the first fall rains or heavy dews cause the spores to germinate and enter those fruits in which the tissues of the navel have been split apart or weakened in growing. It was found by Mr. Pierce that from 10 to 60 per cent of the oranges that dropped from the trees in 1892 as late as March 1 were affected with this trouble. He found, also, that from 1 to 5 per cent of the entire crop was so affected in the sections in which he worked.

The oranges that are affected with black rot ripen prematurely, and can be detected early in the season by their high color, but as the season progresses this distinguishing mark is lost and the affected fruit is packed for shipment.

We do not know the conditions of climate, of soil treatment and of other cultural handling that cause the navel end of the orange to split.

Nothing can be done at this time of the year to prevent the damage caused by black rot. We do not know that it can be controlled in the fall, but it has been suggested by Mr. Pierce that experiments be tried with dry lime and copper sulphate before and after the fall rains. Bordeaux mixture or some of the sulphur remedies might be effective. It might also help in reducing the disease to pick the oranges from the ground and destroy them. It is not enough to plow them under.

There is a direct connection between black rot and the amount of blue mold decay in transit. The black rot breaks down the tissue of the fruit and acts as a mechanical injury in so far as its susceptibility to blue mold is concerned. Therefore, many of the oranges affected with black rot become affected with blue mold while the fruit is hanging on the tree or while it is in transit. These oranges are particularly susceptible to rough handling, as the tissues have already been weakened. It is probable, also, that whenever the conditions of growth cause the navel to split in the fall, this part of the orange remains weak and is unusually susceptible to rough handling. Therefore, in a season like the present one, it is doubly important that fruit be handled with unusual care to prevent injury to the navel, and also that every precaution be used to lessen the chances of infection.

HURST SPRAYERS ON FREE TRIAL

NO-MONEY-IN-ADVANCE
PAY AFTER IT HAS PAID FOR ITSELF

LET US SEND YOU ANY OF THESE SPRAYERS—to try for 10 days, then if you buy, you can pay us cash or we'll wait till you sell your crop, then you can pay us out of the "extra profit." *We pay freight. Wholesale dealers' prices.*

Man-Power Potato and Orchard Sprayer.

Sprays "anything"—potatoes or truck. 4 rows at a time. Also first-class tree sprayer. Vapor spray prevents blight, bugs, scab and rot from cutting your crop in *half*. High pressure from big wheel. Pushes *easy*. Spray arms adjust to any width or height of row. Cheap in price, light, strong and durable. **GUARANTEED FOR FIVE FULL YEARS.** Needn't-send-a-cent to get it "on trial." You can get one **free** if you are **first** in your locality. Write **today.**

Horse-Power Potato and Orchard Sprayer.

For **big** growers. Most **powerful** machine made. 60 to 100 gallon tank for one or two horses. Steel axle. One-piece heavy-angle-iron frame, cypress wood tank with **adjustable** round iron hoops. Metal wheels. "Adjustable" spray arms and nozzles. **Brass** ball-valves, plunger, strainer, etc. Big pump gives vapor spray. **Warranted for five years.** *Try this machine at our expense with "your money in your pocket."* See **free offer** below. Write **today.**

Fitz-All Barrel Sprayer.

Fits *any* barrel or tank. High pressure, perfect agitation, easy to operate. *Brass* ball-valves, plunger, strainer, etc. Automatic strainer. *No "cup leathers or rubber"* about any of our sprayers. Furnished plain, mounted on barrel, or on wheels as shown. *Five year guarantee. It don't cost you "a cent" to try it in your orchard. Get one free. See below.* **Write today.**

FREE—**Get a sprayer FREE.**—After you have tried the sprayer and are satisfied that it is just as we recommend it, send us a list of the names of your neighbors and we will write them and quote them price and have them call and see your machine work, and for every Fitz-ALL Sprayer we sell from your list we will credit you with $2.00 or send you check if you have paid cash.

For every Man-Power Potato and Orchard Sprayer we sell we will credit you with $3.50 or send check.

For every Horse-Power Potato and Orchard Sprayer we sell we will credit you $8.50 or send check.

We do all corresponding and selling. All you need do is to show the sprayer. Many have paid for their sprayer in this way. This offer is good for only the **first** order in each locality. Don't delay. **Send the coupon or post card NOW.**

Braun Chemical Co., Los Angeles, Cal. **So. Cal. Agts.**

Deciduous Bush-Tree Fruits

SOIL INVESTIGATIONS.

Report of Special Committee of the Claremont Pomological Club.

It is of utmost importance that the soil should contain those elements found in the plant, and it is of equal importance to know which elements are removed from the soil by the crops grown in order to maintain the fertility of the soil. Reliable analysis shows that at least ten of these chemical elements are required for the normal growth and development of plant life, but four are most liable to become exhausted, since they exist in larger amounts than the others in plants, and in smaller amounts than the others in soil; they are nitrogen, phosphoric acid, potash and lime, the latter to a much smaller extent.

Humus.

Humus is one of the most important factors in the fertilization and care of our orchards for several reasons: In the first place it puts the soil in the best condition for absorbing water either by irrigation or rain and it improves the mechanical condition of heavy soils by making them more porous and less adhesive; it also helps the light sandy soil by making it more compact, thereby enabling it to retain moisture better and prevent excessive leaching of plant food. Humus also aids in the decomposition of mineral or commercial fertilizers by changing unavailable into available plant food.

There are various ways whereby humus can be furnished to the soil, but we believe the raising of green crops in our orchards is the best and most economical; stable manure furnishes considerable humus to the soil, and some are using straw to good advantage. As stated before, we believe it important to know just what elements are removed from the soil by the crops. Mr. George Wright, a chemist of considerable experience in this class of work, gives the following figures upon the average composition of the California oranges, estimating the crop of a full bearing orchard at 500 loose boxes or about 20,000 pounds of fruit to the acre, as removing from the soil nitrogen 36.8 pounds; phosphoric acid 10.6 pounds; potash 42.3 pounds and lime 19.7 pounds. He also shows in the following analysis that the tree takes up nitrogen 1.40, phosphoric acid .53, potash .90 and lime 1.57. In connection with the above analysis there are certain soil conditions that must be taken into consideration, regarding mechanical and chemical losses which can best be determined by the grower who knows these conditions of his land best; but we believe that the above table gives us a proportionate basis to work on.

Soil Analysis.

Satisfactory results of soil analysis have not been realized as our soil on different parts of the same field differs so widely, also there is no known method of analysis by which it can be determined how much nitrogen, phosphoric acid and potash found in the soil are immediately available as plant food. Nearly all agriculturists and chemists agree that liberal applications of stable manure with intelligent cultivation will produce good crops on most soils as it makes quite a complete fertilizer and also furnishes considerable humus to the soil, an important factor. But it is hard to get and expensive to handle, therefore we are obliged to use extensively of commercial fertilizers.

Commercial Fertilizers.

As to the soil needs we believe that this is a question that each individual rancher must to a great extent, work out himself, as our soils differ so much. He must take into consideration the condition of his tree, his crops, his soil, and with the data available of reliable scientists he ought to arrive at the proper proportions of the different elements that his soil requires. A great deal of fertilizer is being bought in a co-operative way through the different exchanges and supply companies at a considerable saving to the grower. The Pomona Growers Fumigating and Supply Co. quote the following prices on simples:

Simples.

Nitrate of soda $40.00 per ton, 15 per cent nitrogen guaranteed, add freight from San Pedro.

Mococa superphosphate $1.30 per unit, guaranteed 17 to 18 per cent phosphoric acid.

Braun Chemical Co., superphosphate, $1.10 per unit, guaranteed 17 to 18 per cent phosphoric acid. Potash $54.00 per ton and freight from San Pedro. The price of simples depends a great deal on the source they are derived from and their availability as fertilizer depends upon this source also. Parties using fertilizer in the simples should exercise great care as most fertilizers in this form act quickly, several light applications being preferable to one heavy application.

Complete Fertilizers.

It is impossible to give one formula for complete commercial fertilizer that will meet the requirements of all on account of the great difference in our soils. The source of the different elements contained in the fertilizer has much to do with the price and quality of the same, and a fertilizer consisting of different elements that become available at different times, some slow working, others faster, is of the greatest value, as thereby the tree is being fed all the time. We also believe two applications of commercial fertilizer is better than giving it all to the tree at one time. One or two light applications of nitrate of soda can be given with good results during or before the time of blooming and after the little oranges have set, as we think it helps in holding the fruit, as during this time the tree is taxed to its utmost. Commercial fertilizers used in the spring should contain more nitrogen than those used in the fall and winter; later in the season a fertilizer containing more potash and less nitrogen should be used as it hardens the wood, thereby putting it in better condition to withstand the cold and it helps the quality of the fruit considerably. The following formula is being used a great deal with good results at this time of the year and for early spring: Nitrogen 4 to 5 per cent; phosphoric acid 8 to 10 per cent potash, 4 to 5 per cent.

In the fall and early winter less nitrogen and more potash than this. The above proportions compare favorably with the analysis of plant food removed from the soil by the fruit and the tree.

The committee consisted of J. J. Becker, C. A. Phelps and H. D. Roe.

Likfresh Your Fruits and Vegetables

To the Readers of the California Cultivator:--

THE CALIFORNIA LIKFRESH CO. earnestly invites you to visit its demonstrating plant and bring products from your orchard or garden to be Likfreshed free of charge.

The process is termed LIKFRESHING because the products treated contain in their cell structure the essential oils, acids, sugar, and other constituent elements unimpaired and require only water to restore them to their **original appearance, color** and **flavor** when cooked.

FRUIT GROWERS OF CALIFORNIA: With a Likfreshing plant on your place or in your vicinity, you can furnish the markets of the world throughout the year with peaches to be eaten with cream, strawberries for short cake, and other fresh fruits without refrigeration or cold storage.

VEGETABLE GROWERS: Think of being able to market all over the world throughout the year, corn on the cob, string beans, peas, cauliflower, asparagus, etc., with freight charges greatly reduced and with canning expense and danger of ptomaine poisoning entirely eliminated.

A LIKFRESHING PLANT IN YOUR COMMUNITY means the conversion of your perishables into staples that may be marketed anywhere and at any time. It brings the market of the world to your door no matter how remote your section may be.

THE ESSENTIAL PARTS OF A LIKFRESHING PLANT: (1) The drying chambers so constructed as to eliminate the vertical heat rays and so to distribute the lateral rays as to greatly hasten the evaporating process. (2) The Furnace so constructed that it will give all the heat required with only one-sixth the fuel necessary for an ordinary evaporating plant with heat and air supply under perfect control from the floor on which drying is done.

Plants are built in units to hold 200 (thirty-pound capacity) trays and averaging one ton of dried product in 24 hours. Cost of plant is nominal and cost of operating is less than evaporating or even sun-drying.

THE ADVANTAGES OF OUR PROCESS.—It requires less time and less expense. Requires little sulphur for bleaching. Gives more dried product per ton of green product. Superior quality of product in every respect.

It will be necessary for you to come at once and file your order if your community is to have a plant for this season.

If we fail to substantiate any claim made in this announcement, we will pay the expense of your trip.

The Right Paint For This Spring

You can't afford to let your house stand exposed till oil drops in price. The way things look now, the buildings would be paint-hungry before that time comes.

Get the cost of 100 pounds "Dutch Boy Painter" White Lead, 4 gallons pure linseed oil, 1 gallon turpentine, 1 pint turpentine drier—this makes 8 gallons of pure white lead paint. Divide by 8 for the price per gallon and compare this with the price of any other paint you'd think of using.

You'll find that the best is the cheapest; also that, after all, the increase in the cost of "Dutch Boy Painter" White Lead made-to-order paint is trifling.

Write for our free "Helps No. 1226
It answers all paint questions.

This pipe is easily handled and cheaper than flumes. It will last a life-time. For irrigating alfalfa it is the only pipe to use. We make RIVETED PIPE AND TANKS. Write for Illustrated Catalogue, also SPECIAL IRRIGATION FOLDER which may mean much to you.

American Steel Pipe & Tank Co., General Offices 342-43 Pacific Electric Bldg., Los Angeles, Calif.

THE RISE OF THE PRUNE.

The once despised, though delectable, prune has come into its own. Erstwhile it was the prize dried joke. It was associated with most of the attempted humor in which the humble class of boarding houses figured, says the "Packer and Canner." To be "full of prunes" was a few years ago a condition similar to that implied by the more up-to-date term "loony." Times have changed. Prunes have changed. They have joined the flock of useful and worthy commodities that have taken unto themselves wings and may be classed among the aviators, along with hen fruit, hog meat and butter.

Because of a world-wide crop shortage, California prunes are on sale at the highest prices they ever brought.

On a bag basis, California prunes now are selling for 6 cents a pound, and they are expected to advance to 7 and 8 cents a pound during the winter.

"The shortage in this state is very great," said Percy R. Wilding. "Last year 180,000,000 pounds of prunes were grown here, and this year only 80,000,000 pounds were produced.

"Europe, the prune crop of which also is short, has bought about 60,000,000 pounds of prunes from California. The remainder of the state's crop has been, for the most part, distributed throughout the United States.

"The crop now is nearly all marketed. Not more than 100 cars are still unmarketed in California.

"While, of course, the bulk of the state's prune crop is shipped outside its borders, the home consumption is considerable."—San Jose Mercury.

FRUIT PROSPECTS IN ROGUE RIVER.

The prospects for a heavy yield of apples and pears in the Rogue River Valley were never better. During the past couple of weeks I have been pretty well over the orchard districts of the valley from Ashland to Grants Pass and find trees of practically all varieties of pears and apples heavily set with buds. A critical examination of the pear orchards, in particular, shows that they are more heavily set with fruit buds than a year ago. The Bartletts are perhaps in the lead, but this is natural since this variety is not only an early bearer, but a very regular one. The other varieties, however, are well set, and there should be one of the best crops of pears of all varieties that the valley has ever seen.

The present prospects for a heavy crop are brightened by the fact that at this time the excess in precipitation over last year is more than five inches. Up to this time, weather conditions have been ideal, the bright but cool weather has held back the buds, and it is to be hoped that it will continue for some weeks. We hope to see the blooming season for all varieties more nearly the normal this year. Pears should not come into bloom until after the first week in April; and apples, of course, from a week to ten days after that date.

The number of acres of all varieties of fruits to come into bearing this year is about 3000. O course, this is a very heavy increase over last year, but this increase comes from a number of very fine young orchards planted from six to eight years ago and which have been given the best of care. Naturally, we expect such trees to help to swell the grand total. It is a little too early to estimate the number of cars which we expect to ship, but to be very conservative, the amount of fruit to be sent out of the valley this year should easily double last year's output. In connection with this statement I wish to say that every orchardist should avail himself of every opportunity to keep posted on weather conditions, time for spraying, and for every other orchard practice which will help him to protect his crop. There is no trouble in saving crops from any cause whatever in the Rogue River Valley if the orchardist will give intelligent attention to the details of the business.—P. J. O'Gara, in Medford Mail-Tribune.

PLANTING FOR POLLINATION.

Discussion at the Prosser horticultural meeting developed the fact that size and color of fruit are influenced more or less from cross pollen. While many trees will bear fruit from their own pollen, it is safer to plant with suitable intermixed varieties. The Oregon experiment station has in press a bulletin on this subject. A previous bulletin by this station indicated, among many other interesting items, that the Red Cheek Pippin gave best results in cross pollen for Spitzenbergs, but several other varieties gave fair satisfaction, among them being the Arkansas Black. Mr. E. L. Stewart of Prosser is planting Arkansas Black with Spitz, believing it has some influence in producing a darker color. It is the opinion of fruit growers, however, that cross pollen has greater influence on size than color. This is another of the problems requiring further investigation, but the Bartlett pear is known to have been considerably influenced in size from cross pollen, as have also other fruits. One of the essentials is to plant trees intermixed which bloom during the same period. In orchards where four or five varieties of the same class of fruit are grown, cross pollen is most likely to be sufficient, for the distribution of pollen is largely done by bees, yellow jackets and insects of this class. To be on the safe side it is best to plant not more than six rows of trees of one variety in a block, then intermix, but figure on setting suitable varieties to facilitate picking and packing.—N. W. Horticulturist.

Natives digging and loading asphalt at Trinidad Lake

All "asphalt roofing" is not Trinidad Lake Asphalt Roofing—there's a great big difference. Look out for that when you buy your roofing.

Ordinary so-called asphalt roofings are made of artificial products masquerading as real asphalt. They are nothing more than the residue from petroleum oil or native bitumens made into a black pitch, which is easily affected by changes in weather.

Genasco

the Trinidad-Lake-Asphalt Roofing

is made of genuine *natural* asphalt—perfectly stable and uniform in quality.

Trinidad Lake Asphalt is endowed by Nature with *natural* oils; and they stay in it. This gives Genasco its wonderful resistance to rain, snow, sun, wind, heat, and cold—and keeps it lastingly waterproof.

The artificial asphalts have oils *mixed* with them, but they haven't the quality of the oils in the natural product; and they soon evaporate and leave the roofing "dead"—and it cracks, breaks and leaks, although at the first it may look like Genasco, the real Trinidad-Lake-Asphalt roofing.

To make sure of roofing that will permanently protect, ask your dealer for Genasco, the Trinidad-Lake-Asphalt Roofing, with either mineral or smooth surface. Fully guaranteed.

The **Kant-leak Kleet** waterproofs the seams of Genasco Roofing without cement, does away with nail-leaks, and gives the roof an attractive finish. Ask your dealer for Genasco with Kant-leak Kleets packed in the roll.

Home Grounds Beautiful

THIS MONTH.

All the spring work which has not been done before this should be taken up with vigor. Gladiolus bulbs should be planted, and those which were planted earlier may be encouraged by abundance of water and a mild fertilizing. Plant at once asters, daisies, pansies, chrysanthemums, salvia, tuberoses, sweet peas, coleus, cannas and elephant's ears. All kinds of annuals, in fact, may be sown. Poinsettias may be reset and cosmos for fall display should be planted at this time.

A little later in the month young carnation plants should be put into the ground. This is one of the best months for transplanting bulbs of nearly all kinds, bogainvilleas, bignonias, and other flowering vines.

There is no better time for starting a new lawn and the beauty and vigor of the lawn for the entire summer may be insured by giving abundance of fertility and care at the present time. Well rotted stable manure scattered over and washed into the soil with the hose, or in the absence of such fertilizer, commercial or bone meal, will answer. In fact, the commercial fertilizer saves danger of carrying weed seeds into the soil.

A PLANT THAT STORES WATER.

A peculiar plant function which Doctor MacDougal and his associates are investigating is the storage of moisture by plants such as the cacti. I felt as if we had become almost as skilful as Indians when we took our first drink from a chunky barrel cactus. Doctor MacDougal cut off the top with a big sheath knife. Then we pounded the pulpy interior with the butt end of a stick of the green-barked palo verde tree. It was hard work, for our cactus was unusually large and tough. Little by little, however, the fibre broke up, cool drops of sap flew into our faces at every blow, and soon a mass of soft broken pulp filled the hollow which our pounding had produced in the top of the truncated cactus. With our hands we squeezed the fluid out of the pulp into the hollow, and then drank it—a whitish, but not unpalatable, liquid with no special taste except that of plants in general. All the cacti and many other desert species of the xerophytic type possess this same property of storing water. The length of time that they can remain moist is amazing. Doctor MacDougal has removed specimens from the ground and placed them in dry air for several years. No new water has been accessible to the plants, and yet year after year they keep on thriving. The gourd-like storage organ or bulbous stem of an Ibervillia which he placed in the New York Botanical Gardens in 1902 has sent out green shoots each year at the proper season. After producing them, it has, as it were, drawn back part of the moisture from the stem and leaves and gone once more into dormancy. Except at the time when it sends out leaves the plant loses water at an extremely slow rate, as is shown by frequent weighings. Doctor MacDougal estimates that the plant can live at least twenty years, and possibly more if the rate of loss should diminish as it grows older. Compare this with any plant of moister regions. There is scarcely one that could live twenty days, let alone twenty years, if pulled up by the roots and hung in a dry room. Desert plants are very slow in growing; they are correspondingly slow in drying.—Harper's Magazine.

INGENUITY OF FENCH GARDENERS.

Speaking of the great ingenuity manifested by French gardeners in producing flowers out of season, an English paper says:

"Not content with producing the earliest vegetables, the primeurs of every kind which are raised by infinite industry and skill in the market gardens round Paris and other cities, they are able in mid-winter to supply the market with flowers which are generally believed to be grown only in the south. You must have often seen omnibuses in Paris—those dear, clumsy, swaying, three-horsed omnibuses—marked "Montrouge." You have only to take one, and for the sum of threepence as an inside passenger or three-half pence on the top you will be set down close to an establishment where lilac in great qpantity is at this moment flowering to perfection, although the month is January and the temperature last night went down to twenty-four degrees.

"A vast hothouse is filled with bushes transplanted thither in the autumn and brought to maturity by artificial means. The air has to be kept very dry and the temperature must remain always at about sixty-five degrees. Further, the lilac, of course, needs very careful tending. A host of gardeners is at work all the time, trimming, snipping, straightening, so that each branch may fetch its full price and make a brave show in the shop window. Nor does the ingenuity of man (Frenchman) stop here. The lilac can be colored according to demand. If the natural hue, the mauve, is in fashion the plants grow in the full light. White is produced by darkening the hot-house. Even variegated lilac can be grown by a combination of light and shade. Also, the flowers can be made to blossom whenever they are wanted. There are in that Montrouge establishment plants in every stage—some merely with the earliest little pellets of blossom; others just in bud; others, again, full-flowered, ready to be cut at once."

THE MELON PAPAW.

Carica payaya growing in the open at Hollywood are finer sepcimens than we have ever seen under glass, where climatic conditions may be created and maintained to grow it to perfection, yet it requires two years' time to perfect the fruit. Even then it is little better in quality than a pumpkin. If grown in a high temperature and moist atmosphere we have been reliably informed that in twelve months from seed it will ripen its delicious fruit. This information is given and these facts stated for the benefit of the novice, who, having a consuming desire to have an extensive botanic garden of tropical subjects, may proceed to attain that end, in an intelligent way, so that, if failure is the result, the chief contributing factors may be known as the lack of heat and moisture.

The rainfall to date at Yuba City, Sutter county, is 26.83 inches.

Garden and Field Crops

THIS MONTH.

Early potatoes which were not planted last month should be planted in practically all sections now. Even melons, squash, cucumbers and sweet corn may be put into the ground. In the very frostiest sections it would possibly be safer to plant the more tender vegetables in paper containers which may be broken away from the ball of earth, after starting, and planting in the open field. If the ground is cold it is well to plant cucumber and squash seeds very shallow, as if planted deeply the sun does not warm the ground enough to prevent rotting of seed before it sprouts. Orange, lemon and loquat trees may be planted to good advantage this month, and of course the deciduous trees which should have been planted earlier may still be handled if greatest care is used. Berries also should have had earlier planting, but may still be planted if necessary.

For succession of crops, radish, lettuce and all other succulent vegetables for the table should be planted almost weekly. Particularly as the days become warm these crops which have their principal value in tenderness and crispness will need frequent irrigations. Garden soil can hardly be too rich for best results.

GARDENING UNDER DIFFICULTIES.

If an English gardener can get results in gardening without sunshine, the Californian should revel in garden truck. The following from the London Daily Mail is an indication of some of the difficulties:

The French garden at Preston Park, to which the King is expected to pay his second visit this week, would please any gardener's eye—French or English. It is probably the most perfect garden in the world, and it is under the care of a Frenchman acknowledged in Paris to be the king of his craft. Major Fraser, the mayor of Hove, who owns the garden, has given the garden artist everything that he desires, and the results are wonderful—even as seen when everything is in preparation for a year's work and we are in the middle of a winter stark and wet beyond parallel.

The garden, which lies very picturesquely, flanked on one side by the railway embankment, on the opposite side by fine elms, on the third and fourth sides by a farmyard and by two houses, is less than one and a half acre in extent, but many parts of it yielded no fewer than six successive crops. The first leaves of the first radish crop were already visible between the lettuce. The radishes and lettuces will be followed by carrots, by cauliflower, by endive, by celery, and winter lettuce. Most of these will be grown on the same spot without any addition to the soil, the later crops, of course, without glass.

The failure of the year was the tomato crop. The plants flourished in rare vigor and bore plentiful fruit, but the sun was too often absent to allow them to ripen. As regards celery, one variety succeeded well, one failed.

LIME AND BARNYARD MANURE.

Burned lime and manure should not be mixed above ground. Ground limestone will not injure the manure, but burned lime will act chemically to set free ammonia in the form of gas. For this reason burned lime should not be mixed with organic manures above ground. When lime and manure are mixed in the soil the ammonia is set free, but will be largely held by the soil so that plants can use it. The lime will have no injurious effect upon potash. It acts on the soil to some extent to make potash available. With phosphoric acid the lime unites with soluble phosphate to make it less available but does no great damage to it usually. It would depend upon the soil and the crop whether to use lime a year before or a year after manure. The manure usually acts to sweeten the soil, though not as much as the lime. From choice we should use lime if possible when seeding down to wheat or grass, rather than with corn. Certainly not with potatoes. It is quite a common rotation to use the manure on corn and follow with potatoes, and then wheat or oats and grass. In such case we should want to use the lime after potatoes. All the way from half a ton to three tons of burned lime per acre have been used, depending on the condition of the soil and the crop. Alfalfa or clover, etc., need most, as do the cold and sour clays.—Rural New Yorker.

THE BLOSSOMS ON THE TREES.

Blossoms crimson, white or blue,
Purple, pink and every hue,
From sunny skies, to tintings drowned
In dusky drops of dew,
I praise you all, wherever found,
And love you through and through.
But blossoms on the trees,
With your breath upon the breeze,
There's nothing all the world around
One half as sweet as you!
Could the rhymer only wing
All the sweetness to the lees
Of all the kisses clustering
In juicy used-to-bees,
To dip his rhymes therein and sing
The blossoms on the trees,—
"O, blossoms on the trees,"
He would twitter, trill and coo,
"However sweet, such songs as these
Are not as sweet as you;
For you are blooming melodies
The eyes may listen to-"

—James Whitcomb Riley.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

ORIGIN AND HISTORY OF THE AYRSHIRE.

The county of Ayr, in which the Ayrshire breed of cattle originated, is situated in the southwest of Scotland, backed by mountains on the east and washed by the ocean on the west, having the form of a crescent and embracing the Firth of Clyde in its circle. The face of the country is hilly, and rises from the level of the sea some 2000 feet to the top of the mountains on the east. The soil is strong and somewhat heavy, being a clay and clay-loam, but thinner on the tops of the hills and mountains, the whole being originally covered with a dense growth of timber. The climate is moist, with a temperature ranging from about twenty-five to sixty-five degrees, with a mean temperature of about forty-seven degrees, regulated by its proximity to the sea, and with frequent rains, which are favorable to growth of grass, giving luxuriant pasturage, though sometimes the country is swept by fierce coast storms.

The Ayrshire is probably the youngest of the thoroughbred dairy breeds, and though her origin is veiled in some obscurity there are many things that confirm the theory that the native wild cattle of the country are the foundation of the Ayrshire of modern times. The original native wild cattle of the country were said to be white, with red ears and black noses, high white horns with black tips, with an animal now and then having more of the brown, black or red, very mild, and the bulls fierce, but when calves are taken young grow to be quiet and tame. This theory seems the more reasonable when we consider how easily the Ayrshire color reverts to the white.

The first we hear of any effort being made to improve the native stock of the country was about the year 1700, and this was said to have been accomplished by selection and better care.

We read from Aiton that about 1750 the Earl of Marchmont purchased from the Bishop of Durham, and carried to his seat in Berwickshire, several cows and a bull of the Teeswater or other English breed, of a brown and white color. He also writes that about 1770, bulls and cows of the Teeswater or Shorthorn breed were said to have been introduced by several proprietors, and it is from them and their crosses with the native stock that the present dairy breed has been formed.

In 1811, in "Survey of Ayrshire," Aiton writes that the Ayrshire dairy breed is "in a great measure the native indigenous breed of the county of Ayr, improved in their size, shapes and qualities, chiefly by judicious selection, cross coupling, feeding and treatment for a long series of time and with much judgment and attention."

From about the beginning of the last century we find frequent mention of efforts for improvement in the shape of body, and especially in the shape of the udder.

At the present time writes Prof. Fraser:

"There are two types of Ayrshires in Scotland; the show type and the producing type. The show type has been developed for the show ring, and bred for beauty alone. The genuine show udder must be compact and closely attached, both before and behind. The sole must be flat with no indentations between the teats, and the udder must not protrude behind, but be carried up even with the thighs, and have small cylindrical teats, evenly placed on the flat bottom. This is the only kind of udder that can be shown many years in succession and not become too pendant for the show ring. Any intelligent dairyman knows that this type of udder is fleshy and does not belong to the best producers. This craze for tight, close, shallow udders started in the show ring about 25 years ago. It has been of untold damage to the Ayrshire breed and has split breeders into two factions—one of which is breeding for show and the other for production. The breeders who are breeding for production belong to test associations and keep accurate records of their cows. The latter cows have good udders that milk well away, and large, soft teats that are easily milked. One of the best authorities in Scotland upon this subject says: 'The show ring has been a curse to the Ayrshire breed. Ayrshires would be a different breed today had there never been a show. The leading exhibitors of show Ayrshires of the flat, fleshy udder type have not made money, even if they have sold their stock at large prices, because they did not get enough milk to bring up the profits. One of the leading exhibition herds produced only half as much per cow as did another herd bred for production alone. This shows the folly of running to fads. You American dairymen are making a great mistake in allowing showmen to be your importers, as they are taking over only the show type. By this means you are losing, to the American Ayrshire, the advantages of our record Ayrshires in the economy of milk production.'

"Record Ayrshires are gaining rapidly in popularity. At the Highland show Ayrshire cows must produce, the night and morning before the exhibition, 36 pounds of milk, or they are not eligible to enter the show ring. This has the advantage of preventing the cows being bagged before showing. To prevent fraud in all competitions, cows are milked out in the open. Foolish fads are gradually passing away, and at the present time color does not count for much in the Ayrshire show ring in Great Britain.

To the Ayrshire and dairy interests of America, it is imperative that the Ayrshires imported be not of the show type, but the magnificent producing record Ayrshires so often seen in Scotland. When we consider the low efficiency of the average cows milked in America compared with the average Ayrshires milked in Scotland, it is easy to see the great possibilities yet unattained by the dairymen in this country."

Mr. Valentine writes: "The Milk Records Society of Ayr is doing a great work for the breed in encouraging the keeping of records, the necessity for which has been borne forcibly in upon the Scotch breeders by the

Heavy Fence
For Economy

WOVEN-WIRE FENCES must be heavy as they have to turn animals by sheer strength of the wire. A fence with barbs is protected from excessive pressure because the animal fears the barbs. Remove the barbs and the greatest strength of the animal is thrown upon the fence. Its wires must be larger and stronger. To have a long-life woven-wire fence the fence must be heavy.

AMERICAN FENCE

is a thoroughly galvanized square mesh fence of weight, strength and durability. Large wires are used and the whole fabric is woven together with the American hinged joint (patented)—the most substantial and flexible union possible. Both wires are positively locked and firmly held against side slip and yet are free to act like a hinge in yielding to pressure, returning quickly to place without bending or injuring the metal.

Dealers Everywhere—Stocks of American Fence are carried in every place where farm supplies are sold. The Fence is shipped to these points in carload lots, thereby securing the cheapest transportation, and the saving in freight thus made enables it to be sold at the lowest prices. Look for the American Fence dealer and get the substantial advantages he is enabled to offer. He is there to serve the purchaser in person, offer the variety of selection and save the buyer money in many ways.

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century. full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 30 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

ARNOTT & CO., 118 South Los Angeles St., LOS ANGELES, CALIF.

fact that they have lost the Swedish market, owing to the fact that the Swedes, who were at one time among their best customers, have found records so valuable among their own herds and now so universally have them that people in Sweden will not buy even an animal from the Home of the Breed unless she has her certificate of merit in her hand. In Sweden no Ayrshire bull can any longer be registered unless out of an A. R. dam.

Fortunately of late years the importations we have been receiving have been from producing dairy herds, and have been selected by practical men, otherwise the demand would have ceased entirely.—C. M. Winslow, Secy. of Ayrshire Association.

NEUFCHATEL CHEESE.

The soft-curd rennet cheese known as Neufchatel, made extensively in the Department of Seine-Inferieure, France, from cow's milk, either whole or skimmed, has become very popular in the United States, but in this country the process of manufacture has been considerably changed, so that as now made it represents a different type and is ready for use as soon as made, whereas the French variety is allowed to ripen for several weeks. A recent Cornell bulletin describes the process of manufacture as now practiced in both countries.

Foreign Method of Manufacture.

Fresh milk is set at 85 degrees Fahrenheit, with sufficient rennet to cause a thorough coagulation in twenty-four to thirty-six hours. The curd is then placed in cheesecloth bags and allowed to drain for some twelve to twenty-four hours. The draining is assisted by the application of light pressure. When the curd is dry enough it is pressed into cylindrical shapes one and three-quarters by three inches, and salted from the outside. It is then allowed to drain for several hours, and is placed in a ripening room, where in a few weeks it becomes covered with white and blue mold. The cheese is then placed in a cellar for further ripening, and when red spots appear on the outside it is wrapped in paper and tinfoil and marketed.

A Good Method.

J. Michels, of the North Carolina Station, states that American methods of making Neufchatel cheese are unsatisfactory because they are too slow, the souring process is not properly controlled, with a consequent lack of uniformity of product, and the product is not properly packed. A method of procedure which he found was not subject to these objections is as follows:

Whole milk re-enforced with an amount of cream equal to about one-quarter that in the whole milk makes the best Neufchatel cheese. However, whole milk without the addition of cream will make a very satisfactory cheese. It is of first importance to use only milk which is clean and free from taints.

When the cheese is made on a small scale, common cans of the shotgun style will answer for handling the milk. Where several hundred pounds of milk are used, a small milk or cream vat may be used. A strainer with perforated sides and bottom is also needed to drain the curd. * * *

The milk should be treated with a large amount of starter or pure culture of lactic-acid bacteria. On an average, one pound of starter to four pounds of milk will give best results. During warm weather when the milk has already ripened somewhat, and when there naturally is a more rapid development of lactic acid, one part of starter to five of milk will be about right. On the other hand, during cold weather, or when the milk is very sweet, it is best to use at the rate of one part starter to three parts of milk. Thoroughly beat or shake the starter and strain it through one thickness of cheesecloth before adding it to the milk.

As soon as the starter has been added, heat the milk to 80 degrees Fahrenheit, and add at the rate of two and one-half ounces of commercial rennet extract per 1,000 pounds of milk. The rennet extract should be diluted with water to the extent of about eight times its own volume and then thoroughly mixed with the milk. The mixing should not be continued for more than three minutes. This precaution is necessary, as the milk begins to thicken in about five minutes. Cover the milk and allow it to stand quietly for thirty to sixty minutes, according to the amount of starter used. The more starter used, the quicker the milk will curdle.

While the milk will usually be ready to cut in from thirty to sixty minutes, it is best to determine when this point is reached, as for Cheddar cheese, by breaking the curd with the forefinger. If the whey in the break is clear, the curd is ready to cut; if milky, the curdling has not progressed for enough. In general, the curd should be somewhat firmer than for Cheddar cheese before cutting.

Where much cheese is made, the curd is cut with special knives used with Cheddar cheese. The cutting in this case is done as follows: First cut the curd in horizontal layers with the horizontal knife; next cut lengthwise,

NEW TRACTION ENGINE For Sale or Trade

We have a brand new 40 H.P. Traction Engine (Hart-Parr make), which we will sell or trade for land, horses or what have you? We ordered this engine to put in some land and sold the land before the engine arrived. It has never been used. Cost $3,000. Address EDW. GREENFIELD, 100 Chamber of Commerce Bldg., Los Angeles.

and then crosswise with a perpendicular knife. This will make cubes about one-half inch on a side. Where small quantities of cheese are made, any kind of a knife may be used to cut curd. The smaller the amount of milk used, the coarser the curd should be cut.

As soon as the curd is cut it is carefully poured into a tin strainer lined with one thickness of cheesecloth. Both the sides and bottom of the strainer should be perforated. It should be about ten inches deep and of such width and length as to permit filling it the full depth. Allow the curd to drain undisturbed for about one hour and then put a cover, preferably a metallic one, on it and add pressure at the rate of one pound for every gallon of milk used. During the next hour gradually increase this pressure until five pounds are used for every gallon of milk. Continue this amount of pressure for eight hours and then reduce to two pounds for every gallon of milk and keep at this pressure twelve hours longer, when the curd is ready to salt.

Salt at the rate of about one ounce of salt to six pounds of cheese. The salt can be evenly distributed during the mashing process.

With a heavy masher, similar to a potato masher, thoroughly mash the curd to a smooth consistency, leaving no unbroken particles or lumps. The smoother the curd, the richer it will appear and the better it will taste.

A variety of packages may be used in which to pack the cheese. The common method of packing is to wrap the cheese first in parchment paper and then in tinfoil. This method of packing is especially suitable where cheese is made on a small scale. Such a package is open to the objection, however, that it does not sufficiently exclude the air to prevent molding.

The best package is one in which the cheese can be kept as nearly airtight as possible. We have found a tin-capped tumbler the most satisfactory. The only objection to the tumbler is the expense when purchased in small quantities. In large quantities, eight-ounce tumblers may be purchased very cheaply.

The tumblers and the parchment caps which are put under the tin caps should be sterilized in boiling water before using. With a large spoon pack the tumbler brimful, place a parchment paper cap on top, and then cover with the tin cap. The parchment cap should project about one-quarter inch over the edge of the tumbler. Cheese packed in this way will keep ten days during warm weather without refrigeration.

In making Neufchatel cheese as herein described, a good starter is indispensable. It will pay well to give the starter careful attention. Use attractive labels on the tumblers. They cost little, but will help sell the cheese at a better price. While the cheese can be kept some time without refrigeration, it is best to keep it in as cool a place as possible, such as a cellar.

Prof. Michels thinks that Neufchatel cheese packed in eight-ounce tumblers should readily sell at ten cents per tumbler net, and at this price will yield a good return to the producer and furnish the consumer a wholesome and digestible food at a very reasonable cost. One hundred pounds of milk containing 4 per cent of fat will yield thirty-four eight-ounce tumblers of cheese. When such milk is re-enforced with cream as suggested above, 100 pounds of it will yield thirty-eight tumblers of cheese.—Farmers Bulletin 435.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

FOR A REAL PARCELS POST.

"The present fourth-class postal rate is but little used in this country simply because it is prohibitively high," says Fremont Rider in the World's Work for April. "To send ten pounds of merchandise from New York to Philadelphia involves not merely the indefensible nuisance of separating it for mail transportation into three packages, but a charge of $1.60. Naturally, instead, the merchandise is sent in one parcel by express for fifty cents. As the work done by the express company, it is needless to note, gives them a very handsome profit indeed, it is evident that by far the larger portion of the government's $1.60 in this case would be sheer profit—if the postoffice were as efficiently conducted as the express companies."

"Of course, were the postoffice rate from New York to Philadelphia a real parcels post rate, that is, for example, 20 cents for ten pounds instead of $1.60, there would be 1000 pounds of merchandise so sent where there is one sent today. People will use a parcels post when it becomes cheap enough to be an economic possibility, and they will use it enormously, as experience elsewhere has abundantly and conclusively proved."

A CONVENIENT KNIFE-SHARPENER.

There is one very effective way of sharpening a knife always at hand. The rough, unglazed bottom of a jar offers a fine substitute for a whetstone. Just hold a jar of any size upside down and pass the cutting edge of a knife back and forth over the bottom a few times, turning first one side, then the other. You will be pleased with the result.—Woman's Home Companion for March.

IRRIGATED LAND OPENING

MERCED COUNTY

MERCED COLONY NO. 2

A 3,000-acre tract divided into small farms. Just secured from the great Crocker Estate. Now offered for the first time. Located on main line of Santa Fe, with station on tract. Canals already cross land. Especially adapted to the growing of Alfalfa, Dairying and Hog Raising.

Write today for particulars.

Send this to us.

CO-OPERATIVE LAND & TRUST COMPANY,
595 Market St., San Francisco.

CONTENTS THIS WEEK

TIME FOR PLANTING EUCALYPTUS, Cover.

FRUCTIFICATION OF THE FIG, 419.

OLIVE CULTURE FROM NURSERY TO BEARING, 419.

CITRUS AND TROPICAL FRUITS.—Relation of Black Rot to Blue Mould Decay; 420, 421.

DECIDUOUS FRUITS.—Soil Investigations; Rise of the Prune; Fruit Prospects in Rogue River; 422, 424.

HOME GROUNDS BEAUTIFUL.—This Month; Ingenuity of French Gardeners; Plant that Stores Water; Melon Papaw; 425.

VEGETABLE GARDEN.—This Month; Gardening Under Difficulties; 426.

DAIRY AND LIVE STOCK.—History and Origin of the Ayrshire; Neufchatel Cheese; Real Parcels Post; 427, 428, 429.

EDITORIAL.—Editorial Notes; Announcement; Florida's New Law; Standard Varieties of Chickens; Farmers' Institutes; Terminal Rates; 430.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 431.

PRACTICAL POULTRY CULTURE.—Cheap Incubator House; Dark-Yolked Eggs; Roup; Water for Breeding Ducks; Liver Trouble; Muscovy Ducks; Capons; Preserving Eggs; Diarrhoea in Hens; Keeping Poultry Free from Lice; 432, 433, 434.

IRRIGATION AND FORESTRY.—Protect the Headwaters; Two Years' Conservation; Irrigation Investigations, 435, 436.

QUESTIONS AND ANSWERS.—Chicken Pox; Lice; Best Cherry Root; Right of Way; Hop Vines; Stock for Citrus; Dip for Scabby Potatoes; Lespedeza Grass; Hoop Snakes; Gum Disease; Changing Drakes; Government Land; Standard on Indian Runners; 437, 438.

VETERINARY.—Nasal Discharge; Pink Eye; 438.

TIMELY RANCH SUGGESTIONS.—The Outlook for 1911; Railroad Encourages Good Roads; Why Farmers Need Autos; 440, 441.

HOUSEHOLD.—Real Man with the Hoe; A Pink of a Husband; Fish Recipes; Tomatoes; Cleaning Laces; 443, 444, 445.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market; 446, 447.

The thirty-sixth annual gathering of the American Association of Nurserymen will take place at St. Louis, Mo., June 14, 15 and 16. Headquarters will be at the Southern Hotel. The secretary is John Hall, 204 Granite Building, Rochester.

Every boy and girl capable of acquiring an education should be taught some industrial pursuit. An industrial education is useful to the individual for self-support.—President Strange, Farmers National Congress.

Farming has been raised during the past thirty years from being regarded as the roughest of common labor to the dignity of a profession. That has been accomplished through the agency of the agricultural colleges.—Mayor Love, of Lincoln, at Farmers' National Congress.

The boy and girl living in the country and presumably destined to be agrarians by choice or by fate are entitled to an educational training in the schools quite different from that imparted to the boy and girl living in cities and presumably destined to be urbanites.—President E. E. Sparks, Pennsylvania State College, at Farmers National Congress.

It is now possible for schools, if wisely fostered and adequately promoted, to transform the home, farm and civic life of every nook and corner of this broad land outside the congested districts of large cities, and even there this noble movement may be made to lessen the evils of congestion by winning families to the land in the suburbs while the husband and father continues to earn wages in the city factory.

From all over the state come reports of the campaign against the ground squirrel. The great storms of the first of March destroyed many of them, and where the forces of nation, state, county and individual are united as in some sections, there should be complete eradication of the pest, but the trouble is the careless ones will give no attention to the campaign, and enough squirrels will remain to stock the ranches which do clean up.

"Get ready for the 1915 Exposition" is being sounded on all sides. The last to take up the cry are the poultry people. The Santa Clara Valley Poultry Association called a meeting this week for the purpose of forming a state association composed of representatives of the various associations of the state. The call for the meeting stated that the desire is if possible to keep this show out of the hands of politicians and their friends and have it conducted by experienced poultry breeders.

In his speech in the House on the agricultural appropriation bill, William D. Jamieson of Iowa said: "For the first time in our history twelve teachers in my home county this year declined positions in cities to continue teaching in one-room rural schools, and city boys have been boarding in the country to get the education that these country schools give, which the city schools do not give. Such is the fame of these one-room schools in my county that last year the state superintendents of schools of the thirteen southern states spent two days visiting the rural schools of Page county. Nor is this an isolated case. All over the Middle West this noble work is starting, and these results are following." We trust this same spirit may be enthused into California rural districts and induce some of the best teachers of the state to stay in the country districts and help in the education of the best youngsters in the state.

Alfalfa growers of Chino, San Bernardino county, recognizing the need of co-operation, will at least make the effort to secure some of the money which has heretofore been taken unjustly from them by the middlemen. The average amount of commission which the growers have been paying is $1.50 per ton, or a total of $120,000 from growers in the section where the co-operative movement is started. They feel that $120,000 means as much to them as it does to the middlemen, and they will attempt to sell their hay at a much less expense.

ANNOUNCEMENT.

Having disposed of his holdings in the Cultivator Publishing Company, the writer cannot part with his old friends without a brief word in passing. It seems but a few years ago that the Cultivator was fighting a battle for mere existence; today it stands at the head of the list of farm publications on the Pacific Coast. The prosperity of the Cultivator has been largely due to his friends and associates, all of whom will continue with the paper, constituting a guaranty of its continued growth and success, therefore it is with most pleasant memories that the association is severed, and with the wish that the new management may have the utmost meed of success.

H. A. PERKINS.

The retirement of Mr. Perkins, so long identified with Cultivator interests, brings deepest regret to his former associates. Mr. Perkins has been an indefatigable worker, and has given of his strength that the paper might become a greater power. May he enjoy his well-earned rest.

As announced above, those associated with Mr. Perkins for many years will remain at the helm, and still greater effort will be made to increase the popularity of this paper, which has forged ahead so rapidly. "Better than ever, and only a dollar," will continue the slogan. Mr. Frank H. Thomas, for nearly five years advertising manager, becomes president and business manager.

FLORIDA'S NEW LAW.

Florida proposes to have a state horticultural commission. The session of the state legislature about to convene will have under consideration a bill already formulated whereby it is provided that prior to the first of July, 1911, a state commissioner of horticulture shall be appointed to serve a four-year term, with salary of $2,500 per year, to maintain an office at the University of Florida, at Gainesville. He shall have one deputy, and with the consent of the board of county commissioners of any county may authorize a district horticultural inspector, who shall employ such assistance as in the judgment of the commissioner and the county commissioners may be necessary; these district inspectors to receive $1,500 per annum. The duties of the state commissioner shall be to exercise general supervision and control over the horticultural interests of the state, especially to enforce laws relating to horticulture, and he shall disseminate information upon subjects pertaining to horticultural interests, shall hold meetings for instruction of horticulturists, publish and distribute bulletins, and grant licenses to nurserymen and tree dealers. The bill is very complete, being made up of sixty-four sections, some of them very long.

STANDARD VARIETIES OF CHICKENS.

One question which comes to the poultry department of the Cultivator more than any other is "What breed of poultry pays best?" It usually ends there, though sometimes conditions are given showing wherein the inquirer has attempted to secure light. It is a question that is as impossible to answer as some others which are passed up to the query department. As we heard one poultryman express it, "It is more a question of the breed of the poultryman than of the poultry."

CLEAN UP.

Various papers up and down the state are suggesting the advisability of an early beginning in the dressing up of the state in preparation for exposition year. 1915 seems a long way off, but we may well begin preparing for it now. In the matter of street tree planting and ornamentation it takes but a few months of California sunshine and rain to make a remarkable showing, but a few years is better. The Santa Rosa Democrat chronicles a number of cases of this public spirit, as follows:

"Thirty towns in California have begun to 'clean house' in preparation for the Panama-Pacific Exposition and the vast throng of visitors that the exposition will bring. An astonishing amount of municipal improvement is already under way in the northern end of the state. Chico, Redding, Red Bluff, Willows, Woodland, Davis, Lodi, Dixon, Roseville, Placerville and a score of other places have already felt the impetus and are improving their streets, constructing their needed public buildings, improving their school property, acquiring new fire departments, parks, sewers, water works, and whatever is lacking in each individual case."

TERMINAL RATES

The inland towns of Southern California are making a fight for terminal rates. At present they have not only to pay the regular car rate to the town in question, which is the same as to Los Angeles, but, in addition, a "back haul" charge of the local rate from Los Angeles to the town. It is now learned by those who are contesting this point that beer has been granted this terminal rate by the railroads. This impels the Riverside Press to say:

"Riverside does not deal much in beer, but suppose we did, we could have a carload of Anheuser-Busch shipped here from St. Louis on the same rate that would be charged to Los Angeles; but if we want a carload of potatoes from Kansas, we have to pay 20 or 25 cents a hundred extra for the mythical 'back haul' from Los Angeles."

FARMERS INSTITUTES.

J. B. Neff, conductor of farmers institutes for Southern California, announces institutes at Hemet, April 10; Perris, 11; Elsinore, 12; Arlington, 13; Corona, 14; El Cajon, 17; Chula Vista, 18; Escondido, 19; Fallbrook, 21.

Land from which the timber has been removed, near Sisson, Shasta county, is proving remarkably profitable for the growing of apples.

Agricultural News Notes of the Pacific Coast

Northern California

Sutter county's asparagus harvest is in full swing.

Yolo county's area of sugar beets will be larger than last year.

An icing and pre-cooling plant is being built at Oroville, Butte county.

Eucalyptus Grange of Santa Rosa discussed spraying at its last meeting.

Five thousand acres of eucalyptus will be planted near Dixon, Solano county.

The yearly output of California wine grape vineyards aggregates $15,000,000.

The Alameda Sugar Company already has several hundred acres of beets seeded.

Farmers near Live Oak, Sutter county, are draining large tracts of overflowed land.

The Ashley Machine Shops at Yuba City report heavy shipments of orchard implements.

Rice experts of the Department of Agriculture estimate that California has 200,000 acres of rice land.

The recent legislature passed a bill which will give added power to the directors of irrigation districts.

A filing of 150,000 miner's inches of the Feather river has been made in Butte county above Oroville.

Penryn, Placer county, and neighboring sections are taking up the malarial mosquito fight for 1911.

A tract of land belonging to the Natomas Consolidated Company near Oroville, Butte county, is to be subdivided.

Over 9000 peach and walnut trees have been planted within the last few weeks near Willows, Glenn county.

The time for the completion of the high line canal of the Orland project in Glenn county has been extended to April 14th.

The recent rains put the soil of the orange groves of Butte county in excellent condition and spring cultivation is being pushed.

The first carload of asparagus out of the state went forward March 24th. On account of the heavy, cold rains it was later than usual.

The recent state legislature made provision for a $35,000 fund to aid in improving a road to the big tree district of Calaveras county.

Chico reports the almond crop as promising well notwithstanding the heavy storms which it was thought at one time would prove disastrous.

The Sacramento and San Joaquin river reclamation work calls for the expenditure of $400,000 by the state and an equal amount by the nation.

The Yolo County Consolidated Water Company has caused much contention on the part of irrigators because of rates which the users maintain are unjust.

Oroville and Palermo, Butte county, have been shipping some of their later fruit during the past week. The season is practically closed in that county.

County Horticultural Commissioner Galloway of Sonoma county, has discovered some pear thrips at work and is taking steps for control so far as possible.

Central California

Over 400,000 acres of land is under irrigation in Fresno county.

The first raisin grape vines were introduced into California in 1867.

Terra Bella grain growers report every promise of a big crop of high quality.

Lincoln Grange of Saratoga, Santa Clara county, recently held its annual harvest feast.

April 8 is fixed upon as the date of tne Blossom Day Festival at Saratoga, Santa Clara county.

The general report over Central California is that apricots will be much short of last year.

Watsonville and other coast sections will be visited by the demonstration train the first of the week.

Packers of raisins are now putting pamphlets of recipes in each carton of raisins which they sell.

Almonds at Greenfield, Monterey county, are promising brightest of prospects for the next crop.

The managers of the Kerman Creamery will establish a cream receiving station at Dos Palos.

Secretary Miot of the Tulare County Chamber of Commerce reports many settlers improving new lands.

Dried fruit people are encouraged by reports from the East to expect good prices the coming season.

Squirrel fighters in Monterey county propose to kill every squirrel which was not drowned in the recent flood.

The labeling or selling of eggs under guarantee of freshness is made necessary under an act recently signed by the governor.

The Tulare Grange is discussing the question "What amount of capital ought a young man to have before he begins farming?"

The Interstate Commerce Commission has given orders for the refund of overcharged freight on shipments of Pajaro Valley apples.

Horticultural Commissioner Sharp of Kings county reports all vineyards that he has inspected in the county in the very best of condition.

Orchardists who have tried Commissioner Morris' thrips remedy report that so far as they are able to judge yet it is working admirably.

Homer Craig of Cupertino, Santa Clara county, is still working on his plan to have school vacations so arranged that fruit picking crews may be made up of school children.

A company at Salinas which had sold nearly $2,000 worth of grain for future delivery, but on the price going down it was refused, has secured an award of the full amount of the claim.

Mr. Charles H. Rodgers, President of the Pajaro Valley Apple Association, has been appointed member of a committee of the American Pomological Society. The committee has to do with the revision of the present standards of fruit.

At a recent meeting of the Farmers Educational and Co-operative Union at Valley View Schoolhouse, Santa Clara county, Mr. Joseph T. Brooks, Secretary of the San Jose Chamber of Commerce, gave an address on co-operation and good citizenship.

Southern California

Coachella Valley has just completed its deepest well at 1,510 feet.

Sierra Madre, Los Angeles county, reports a rainfall of 30.84 inches.

C. V. Malone, Otay, gathered during last year 20,570 pounds from one acre of lemons.

Vineyardists in Imperial Valley are planning a fierce campaign against the grape leaf hopper.

A mass meeting was held at Arroyo Grande last Saturday to discuss methods of flood protection.

A gypsum deposit has been found in the Palo Verde section, near Blythe City, Riverside county.

Strawberry growers of El Cajon, San Diego county, are planning a growers marketing association.

The semi-annual meeting of the State Humane Society will be held in Riverside April 21 to 23.

Twenty-one cars of live stock were shipped from Brawley, Imperial county, in one day last week.

Several tracts of land at Bloomington, San Bernardino county, are being taken up by new settlers.

The planting of black-eyed beans in the San Fernando Valley will be more extensive than heretofore.

Orange county lima bean growers are anticipating big crops and the planting will be extensive.

One tangerine orange grower in Bostonia, San Diego county, has shipped 1,000 boxes of tangerines from 200 trees.

The Union Power Company has made a filing on 3,000 inches of water of Bear Creek, San Bernardino county.

Some contracts have been signed by Orange county Lima bean growers at from $4.50 to $4.60 per hundred pounds.

The half-way point in orange shipments has been passed, and prices have been fairly satisfactory to the producers.

Orange county has fully decided to build 133 miles of good roads, and will call an election on a million and a half bond issue.

Some orange growers are looking at the 50,000-car crop of oranges and suggesting the necessity of slowing up in the matter of future planting.

Santa Ana, Orange county, claims to be the largest walnut shipping point in the world. Last season the shipments aggregated 5,200,000 pounds.

San Fernando land owners and the Los Angeles water commission are conferring as to distribution of excess water of the Owens river aqueduct.

Escondido is preparing for a meeting to be addressed by Dr. J. Eliot Coit on April 18, and on April 19 for a farmers institute to be conducted by Mr. Neff.

The Anaheim Union Water Company, while drilling a well near its reservoir, opened up a 400-barrel oil well. The result is that stock in the concern has materialy advanced.

Th directors of the San Diego County Fair Association at Escondido will plan for a bigger fair than ever this fall, hoping to receive aid from the appropriation authorized by the recent state legislature.

The Coast

One hundred pairs of pheasants were recently freed near Corvallis, Oregon.

Sixteen cars of Montana cattle were received in one day at the Portland yards.

Yuma papers report sheep ranges in excellent condition and flocks healthy.

Douglas county, Washington, reports snow disappearing and spring work progressing.

Rogue River Valley, Oregon, claims every train brings purchasers for her productive lands.

The first annual Pacific Northwest Show was held at the Union Stock Yards, Portland, last week.

Grain growers near Nez Perce, Idaho, report the fall grain as in the very best of condition.

The ground at Curley, Ferry county, Washington, was covered with snow from December 10 to March 21.

The Woodburn, Oregon, Horse Breeders Association held its third annual horse fair on Friday, March 31st.

There are 173 Granges organized in 26 counties of Oregon; thirteen new Granges were organized during the last year.

The Central Oregon Irrigation Company will open for settlement between five and six thousand acres near Prineville.

Farmers at Okanogan, Washington, have formed the Southside Water Users Association to supply water to 500 acres of land.

Scientists from the state college at Pullman, Washington, are making a special study of diseases affecting trees near Chehalis.

A pile driver is at work on the Colorado above Yuma, Arizona, straightening the bend and reinforcing the levees to prevent flood damage.

Nine thousand acres of government land will be thrown open to entry May 19th on the Columbia river near Kettle Falls, Eastern Washington.

Stock growers at Harrisburg, Linn county, Oregon, report ideal winter conditions have prevailed and stock have come through in excellent condition.

A two-year-old grade Shorthorn bred in Haines, Oregon, won the championship at the Pacific Northwest Live Stock Show over 816 competitors.

The production of ginseng has become so important in Oregon that the last legislature has enacted measures protecting and regulating the industry.

Walla Walla, Washington, reports "never before in the history of the fruit industry has the outlook for a bumper fruit crop been so promising as at present."

A bunch of 500 Rambouillet sheep, 15 Shorthorn cattle and a number of Berkshire hogs have been shipped from Seattle to the Agricultural School at Mukden, Manchuria.

The 1910 pool formed by the fruit growers of Wenatchee, Washington, secured for apple growers $2.80 for extra fancy's and $2.10 for fancy's. The section shipped over 2000 cars.

ALFALFA SEED

Cheap Seed is dear at any price. But why pay high price for the best?
Write for our price and sample, stating quantity wanted.

READ WHAT OTHERS SAY:

117 Miles Ave., Oakland, Cal., Nov. 12, 1910
Cycle Hatcher Co., Oakland, Cal.
Gentlemen: A year ago we started with the Philo System, and raised as fine a lot of White Orpington pullets as anyone would wish to see. The two machines we purchased of you last season have given excellent satisfaction. We shall probably need more this year, and shall use the Cycle machines in preference to a larger incubator. Yours truly, S. N. Haines

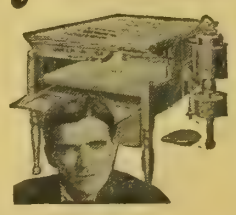
I'll Start You in Poultry on the Make-Good Plan



—Set you up in a paying business all your own—a business you can control and expand indefinitely—one you can operate on little capital and in small space—one that will give you real independence, pleasure and profit. Mail me a card to-day for my book containing the remarkable terms on which I am selling Queen Incubators and Brooders, freight prepaid. I have started over 61,000 people on the road to success. The Queen goes out on the make-good plan, the most liberal ever offered on a high grade incubator. My 1911 Poultry Guide and Catalog explains terms fully. It's a down-to-date poultry book, practical, concise, helpful—best book of the kind published. Write and let me mail it to you free.

Queen

WICKSTRUM, Queen Incubator Man, Box 53, Lincoln, Neb.

Rancho Mirasol White Leghorns

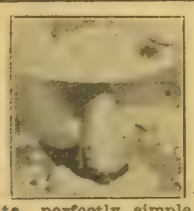
Eggs for Hatching, January to June. Day Old Chicks, March to June.
PASADENA, CALIFORNIA.

White Leghorns

A Standard Strain of Great Layers and Great Winners. None superior. Prices reasonable. Descriptive booklet of our stock and farm and recipe for mixing best and cheapest egg-producing mash, sent free for stamp. Eggs, stock and baby chicks for sale. Also a grand lot of cockerels.

On a separate farm, we have an extra fine lot of Buff Orpingtons, from which we can furnish stock, eggs and baby chicks at popular prices.

MODEL POULTRY FARM Irvington, Alameda County, California



The Arenberg Brooder Stove

Proven to be the most successful Brooder Stove on the market. Awarded gold medal for most Meritorious California invention at California State Fair, Sacramento, September, 1910 Burns distillate, perfectly simple and easy to manage. Write for details. **H. F. ARENBERG, Petaluma, Cal**

S. C. BUFF ORPINGTONS

Eggs for hatching, Utility stock (no culls), $1.50 per 15; special matings.

Send Stamp for Mating List

No visitors on Sunday.

Practical Poultry Culture

DELAYED POULTRY QUERIES.

Answers to a large number of poultry queries have been unavoidably delayed, but we have matters in hand now and will promise more prompt service to poultry people hereafter.

Cheap Incubator House.

Please give information regarding building of a cheap incubator house. I am in a section where sand, gravel and rock are out of the question, so must build of wood. Funds are somewhat limited, and I wish as economical a plan as can be had. Would like to build, say 16 by 20 feet, but do not wish to economize at the expense of efficiency.—Subscriber, Cudahy Ranch, Los Angeles.

We are not certain as to the section where subscriber is located, but if the soil is heavy enough to make adobe blocks, a perfectly satisfactory incubator cellar could be made of them. They would insure the even temperature necessary and we think would answer admirably. If that is not practicable and there is a hillside near, a hole the size of the building could be dug into the hillside and walled up with brick to surface of the ground, or, say, two or three feet above the surface, then the dirt taken out of the cellar can be thrown back on the wall to make drainage perfect. This will make little framework necessary. If there is no hillside, still we would excavate at least a couple of feet in the ground and then bank the soil up two feet above the ground, throwing the dirt back against wall, which would serve the double purpose of drainage away from the building and maintenance of equal temperature. The amount of framework above this wall would be very slight. In this case it would perhaps be necessary to excavate from the front of the building where the entrance should be by means of door, but above all, care should be used in ventilation plan. While the temperature must be kept as nearly even as possible, the ventilation must be perfect at all times. Good lighting is a convenience, but not necessary. If windows are used they should be double sashed.

Dark Yolked Eggs.

What causes hens to lay eggs with dark yolks? We have been getting eggs with ash-colored yellow yolks, of fine flavor and all right, but the off-color I do not like. Hens are laying large eggs in goodly number and seem to be in best condition excepting that they produce these dark colored yolks. We are feeding wheat, scalded barley and coarse bran, with all the alfilaria, alfalfa and sprouted oats they can eat.—T. M. J., Huntington Park.

This is the first complaint we have heard of eggs being too dark colored, and do not understand the ash-colored proposition. As a rule, the complaint is as to paleness of yolk, which may be corrected by abundance of green food. It is barely possible your hens are too liberally supplied with green feed. Experiment with them or part of the flock; depriving them of green feed for a few days would test this point.

Roup.

Have hen affected with roup; she is almost totally blind. Is there anything which will restore her eyesight?—Subscriber, Perris.

We do not think we would waste any time in treatment of so severe a case. Of course, where a hen is a pet, one might take the trouble to treat, but for breeding stock her usefulness is gone. There is no probability of inheritance of the disease, but at the same time weakened constitutions will predispose the offspring to the same trouble. Mild antiseptic washes may help. For treatment we refer the inquirer to an extended article in poultry department of our issue of July 21st, 1910.

Water for Breeding Ducks.

Is it necessary for Pekin ducks to have access to pond of water through breeding season, or will eggs be fertile without?—E. B., Orange.

It is not absolutely necessary, but more desirable, that is, greater percentage of fertility is secured where water is at hand. While this obtains with breeding ducks it does not with young stock, for it is far better if they do not have access to water until full grown.

Liver Trouble.

Combs of poultry turn black and they stand with drooping heads. Feed Egyptian corn twice daily and Coulson's food every other day and occasionally fresh soaked barley. They have all the grit and oyster shell they need.—Subscriber, Turlock.

It is possible you have overfed and indigestion, or liver trouble has resulted. Feed some green stuff and in such a way as to make the hens exercise to secure it, scatter the grain in deep straw so that they will have a day's job to get the morning's feed. Give each fowl affected a liver pill, same as administered to humans. Baking soda added to the drinking water at the rate of a teaspoonful to a quart is also advisable.

Muscovy Ducks.

Where can I get Muscovy duck eggs or a pair or ducks?—Subscriber, Del Rey, Fresno county.

We only have the names of two breeders of Muscovy ducks, Mrs. Ungerland, Route 2, Box 300, Los Angeles, and Caldwell & Co., Route 3, Los Angeles. We would advise other breeders to place their announcements in the Cultivator.

Capons.

Tell me about capons, probable demand, best time of the year for the operation, usual price, best size, how best fattened and dressed. Is there good outlook for marketing them in this section?—Subscriber, Atwater.

We do not think capons have generally proved profitable in this state. In the East near large markets where demand has grown up for this delicate meat, there has been money made, especially on farms where grain is fairly cheap and they have ranged and gathered their own feed. The profit comes in marketing at large size. If they are marketed before arriving at maturity, there is little profit because of the fact that for several weeks after the operation of caponizing they grow more slowly than other fowls. The best season for caponizing is in the early fall and June hatched chicks are preferred. They should have a weight at that time of from two to three pounds. Large growing breeds are always preferred, Cochins or Brahmas, or crosses on these, though Orpingtons, Rocks and Wyandottes are used. Caponizing is simple and easy to learn. In France the farmers' wives and daughters have done the caponizing for centuries and practically without instruments except a sharp knife. In this country and age, we can buy a case of the best instruments with full in-

structions for use at low cost, and the agricultural stations of some states give free demonstration lessons to anyone within the state. By following these instructions and experimenting for the first time on a dead chicken, anyone that is deft can learn it. The operation is performed with apparently little pain to the subject, and the minute the bird is released it will eat heartily and walk around as if nothing had occurred.

Preserving Eggs.

Can you inform me regarding packing eggs in water glass? Articles regarding it have appeared in the Cultivator but I am unable to find them.—Subscriber, Winchester.

This letter is another good argument for the careful preservation of Cultivators. These papers contain much of permanent value and are worthy of a shelf on which they may be put after reading. The index at the end of each volume, the last number in June and the last number in December, aids in referring to articles wanted at a moment's notice.

Water glass is practically the only preservative now used, excepting where eggs are put in cold storage which, of course, is the very best method of preserving. Water glass is the popular name of silicate of soda which should be kept by every drug store. It may be had in dry form or dissolved; the latter is preferable. It is a thick, jelly-like liquid used in proportion of one pint to nine pints of water, though sometimes used in weaker solution. Use pure water which has been boiled and cooled; pack eggs in jar and pour solution over them. There should be fully two inches of water glass over the eggs. Keep in as cool a place as possible and keep covered to prevent evaporation. Do not wash eggs before packing and be sure they are strictly fresh.

Diarrhoea in Hens.

What is the cause and prevention of diarrhoea amongst laying hens? They appear well and are laying fairly well, but seem to be quite seriously affected. Am feeding skim milk, also keeping bran and oyster shell before them all the time. Feed whole wheat, cabbage and plenty of other green stuff. They have pure water. Will chickens hatched from these hens be similarly affected?—Subscriber, Redlands.

We would take away the bran and reduce the amount of green feed for the time being, boil the milk and feed almost entirely on dry feed instead of so much wheat. It would be well to feed barley or boiled rice and corn to a certain extent. If the above diet fails to cure the trouble give pellet made of five grains chalk, five grains rhubarb, three grains cayenne pepper, and half a grain of opium. Mix with dough if necessary to make into pellet and give one morning and evening. A more simple remedy is six drops of camphorated spirits three times daily in pellet. The disease would not be inherited though if hens are greatly weakened the chicks might not be strong and vigorous, hence more subject to any disease.

It is poor economy to keep unprofitable hens because they have been in the flock several years. Sentiment will not compensate for loss in feeding unprofitable hens. Keep a record of the hens and dispose of the unprofitable birds no matter how faithful they have been.

WINTER'S WHITE INDIAN RUNNERS The World's Greatest Egg Producers—First, California State Fair, 1909. First, display pen; first, breeding pen; first, drake; first, duck and second, duck, at the Los Angeles Show, 1910. Eggs $3.00 per 13, $10.00 per hundred. White and Barred Rocks and White Minorcas. Eggs $2.00 per 15, $8.00 per hundred. C. O. Winters, 5807 Washington Ave., Los Angeles, Cal. Phone Sunset East 1197.

This open front door makes perfect ventilation

Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs*. Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

NEW OUTDOOR BROODER
Heated—Storm-proof

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

Incubators and Brooders

The evidence is conclusive that the PETALUMA is the best Incubator buy that can be made. The best value for the money ever offered and is appreciated most by those who have had varied experiences with other incubators. Why? Because it hatches such large, strong vigorous chicks. More Petaluma Incubators were installed in the large hatcheries last year than all other makes combined. No other incubator in the world has a hatching record to equal the Petaluma.

KEEPING POULTRY FREE FROM LICE.

As pointed out in a bulletin of the Maine Experiment Station by Raymond Pearl and Frank M. Surface, "one of the most difficult and trying problems which the poultry keeper has to meet is that of keeping his poultry houses and stock reasonably free from lice, mites and other external parasites."

After testing various proprietary preparations and finding most of them very expensive in proportion to their efficiency, the station adopted the use of preparations based upon formulas proposed by R. C. Lawry, of the New York Cornell Experiment Station, with very satisfactory results.

For the birds themselves experience has shown that the best way to get rid of the lice is by the use of a dusting powder to be worked into the feathers. In using any kind of lice powder on poultry * * * it should always be remembered that a single application of powder is not sufficient. When there are lice present on a bird, there are always unhatched eggs of lice ("nits") present, too. The proper procedure is to follow up a first application of powder with a second at an interval of four days to a week. If the birds are badly infested at the beginning, it may be necessary to make still a third application. To clean the cracks and crevices of the woodwork of houses and nests of lice and vermin, a liquid spray or paint is probably the most desirable form of application.

The lice powder used is prepared by mixing three parts of gasoline with one part of crude carbolic acid, 90-95 per cent strength, or, if the latter cannot be obtained, with one part of cresol, and adding gradually, with stirring, enough plaster of Paris to make when the liquid is uniformly distributed through the mass of plaster a dry, pinkish-brown powder having a fairly strong carbolic odor and a rather less pronounced gasoline odor. As a general rule, it will take about four quarts of plaster to one quart of the liquid.

This powder is to be worked into the feathers of the birds affected with vermin. The bulk of the application should be in the fluff around the vent and on the ventral side of the body and in the fluff under the wings. * *

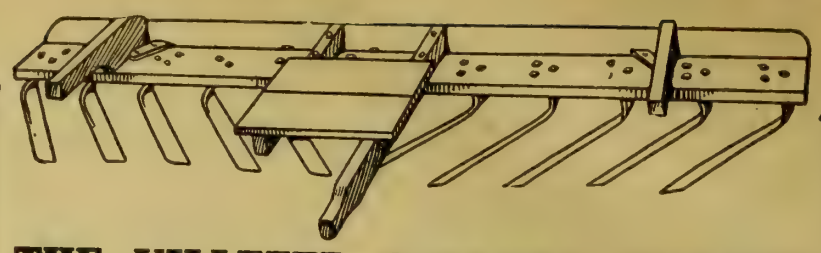
For a spray or paint to be applied to roosting boards, nest boxes, or walls and floor of the hen houses, the following preparation is used: Three parts of kerosene and one part crude carbolic acid, 90-95 per cent strength. This is stirred up when used and may be applied with any of the hand spray pumps or with a brush. If 90-95 per cent crude carbolic acid cannot be obtained, cresol may be substituted for it in this paint.

The routine methods used by the station are as follows:

All hatching and rearing of chickens is done in incubators and brooders. The growing chickens are never allowed to come into any contact whatever with old hens. Therefore, when the pullets are ready to go into the laying houses in the fall they are free from lice. Some time in the late summer, usually in August or early in September, the laying houses are given a thorough cleaning. They are first scraped, scoured, and washed out with water thrown on the walls and floor with as much pressure as possible from a hose. They are then given two thorough sprayings, with an interval of several days intervening, with a solution of cresol. * * * Then the roosting boards, nests, floors, and walls to a height of about five feet are thoroughly sprayed with the lice paint (kerosene oil and crude carbolic acid as described above). Finally, any yearlings, or older birds, whether male or female, which are to be kept over for the next year's work are given two or three successive dustings, at intervals of several days to a week between the applications, with the lice powder described above before they are put into the clean houses.

The cresol solution is prepared as follows: Measure out three and one-fifth quarts of raw linseed oil in a four or five gallon stone crock; then weigh out in a dish one pound six ounces of commercial lye or "Babbit's potash." Dissolve this lye in as little water as will completely dissolve it. Start with one-half pint of water, and if this will not dissolve all the lye, add more water slowly. Let this stand for at least three hours until the lye is completely dissolved and the solution is cold; then add the cold lye solution very slowly to the linseed oil, stirring constantly. Not less than five minutes should be taken for the adding of this solution of lye to the oil. After the lye is added, continue the stirring until the mixture is in the condition and has the texture of a smooth, homogeneous liquid soap. This ought not to take more than a half hour. Then while the soap is in this liquid state, and before it has a chance to harden, add, with constant stirring, eight and one-half quarts of commercial cresol. The cresol will blend perfectly with the soap solution and make a clear, dark-brown fluid. The resulting solution of cresol soap is then ready to use. This cresol soap will mix in any proportion with water and yield a clear solution.

As a result of these methods, the station's poultry plant is at all times of the year practically free of lice.



THE KILLEFER CYCLONE WEEDER

We have Killefer Cyclone Weeders of all sizes on hand. This is a most effective tool for keeping down the growth of weeds after rains or irrigating on orchard, beet, bean or grain land. Guaranteed to do twice the work with the same team of any other tool. As the knives overlap each other, it is impossible to leave anything in their course.

Built in 6, 8, 10 and 12-foot sizes. Blades can be attached to cut in or out as desired.

We are prepared to furnish on short notice straight knives of all sizes for the Monarch and other Cultivators.

This is the season of the year when every effort is put forth to get rid of weeds, and we have the best tools for this purpose to be had.

Irrigation and Forestry

TO PROTECT THE HEADWATERS.

By Guy Elliott Mitchell.

The West lined up almost solidly for the passage of the Weeks bill, known as the Appalachian National Forest Act, possibly, one might believe, as a return courtesy for the Eastern support accorded to the national irrigation bill in 1902. If such support for the forestry measure was solely on this co-operative and friendly basis, the West builded better than it knew. As a matter of fact, the passage of this measure establishes a principle of great importance to California as well as to every region drained by navigable rivers.

This principle recognizes the propriety of purchase by the federal government of any forested (or deforested) watershed, the control of which may be necessary to preserve the flow of any navigable stream, or its tributaries, in any portion of the United States. Both of the California senators voted for the bill, and of them at least it can be said that they fully recognized its possibilities as applying to California. Senator Flint in a private conversation stated that he favored the measure both from a national standpoint and because it established a principle of great importance to Southern California, although this did not as yet go far enough to cover the necessities of that section of the country.

Appalachian Act Limited.

Purchase under the Appalachian act is limited to the forested areas on the headwaters of navigable streams. But the rivers of Southern California on the Pacific slope are not navigable, and yet on the headwaters of these streams there are many areas, some of them entirely surrounded by national forests, which are in private ownership and liable to be denuded and deforested, with great resulting harm to the water supplies. The federal government not having as yet established the policy of buying lands for the purpose of putting them into national forests, has been unable to acquire these lands, and they are likely to remain in private ownership, subject to destructive timber cutting, unless some way can be found for them to be purchased by the government.

The Appalachian national forest bill was a great step forward in that direction, but it does not go far enough. The next and final step, however, mentioned by Senator Flint as necessary for the protection of Southern California, is found in Senator Newlands' "river regulation bill," which makes it possible for the national government to acquire lands which are near or adjacent to national forests, or which are needed for the preservation or regulation of water supplies, without being limited to the watersheds of navigable rivers.

Great Development Possible Under Newlands Measure.

The Newlands bill is a most comprehensive measure, providing for the full development of the water resources of the nation, and this feature of it must commend it particularly to California. The bill appropriates $50,000,000 a year for the period of ten years for the comprehensive development of the water resources of the United States through the existing government bureaus now engaged in water resource work—the army engineers, the Geological Survey, the reclamation service, the forest service, etc. It will be reintroduced by Senator Newlands, and immediately upon the convening of the new congress will be aggressively supported by the National Irrigation Association, which was an active factor in the campaign that resulted in the pasage of the national irrigation law in 1902.

Help North of Tehachapi.

The Appalachian bill has a very wide and far-reaching influence in its application to everything in California north of the Tehachapi mountains and lying on the westerly slope of the Sierra Nevada mountains. The entire interior valley and the watersheds of the Sacramento and San Joaquin rivers and all their tributaries, including Kings river, are on the headwaters of navigable streams, and for that reason the Appalachian bill is aplicable to them. Of course the fund created by that bill would not be large enough to permit of a great deal being done in this section of the country under that particular measure, but it is a tremendous advance in the declaration of an entirely new policy. As Senator Burton said in his speech in opposition to the bill, if the government is to enter upon a policy of preserving forests to protect the waters of the navigable rivers, it should also protect from floods, and that point brings in the whole Sacramento and San Joaquin valleys and all the overflowed lands in those valleys. The Newlands bill provides all the machinery and all the money that is necessary for a complete solution of that problem.

When the Newlands bill is analyzed and understood, it will command the same unanimous support that was given by California to the national irrigation bill.

TWO YEARS OF CONSERVATION.

Over seventy million acres of coal land in the West is still owned by Uncle Sam. The coal content of this land is enormous; it can be figured only in hundreds of billions of tons. Some tracts are of immense value, containing beds of coal of the highest grade, 30, 40, 50, and even 80 feet or more in thickness. The old way was to sell the coal land, regardless of value, at the absurd figure of $10 an acre if it was more than 15 miles from a railroad, or at $20 if within that limit. The present way is to measure the coal in an acre and sell the land at a price determined by its content of coal. As a result coal land has been priced as high as $400 an acre and one tract at even $600 an acre. Since March 4, 1909, the Geological Survey has classified, by 40-acre tracts, 8,527,166 acres of the government coal lands, at a total valuation of $560,815,081. Including the work done under the last administration a total of 13,480,538 acres has now been classifield as coal land, at a valuation of $637,619,418. At the $10 to $20 minimum rate these lands would have a valuation of $218,289,942, so that the work done has resulted in a gain to the government of nearly $420,000,000. It may be noted that the proceeds of coal land sales are all deposited to the credit of the "reclamation fund"—the fund that pays for the construction of the government's vast water storage projects.

WHY NOT TURN THAT CREEK OR POND INTO A VALUABLE ASSET

On having sufficient water depends the success of your crops. On the success of your crops—your living.

You can't always be sure of enough rain—but if you have a creek, pond, slough, or other source of water supply you can hitch it up to an I H C Gasoline Engine and pump the water where and when you need it. The cost is slight—the results sure.

Gasoline Engines

are the most economical, efficient power known for pumping water and doing other farm work.

They are simple—strong, and easily operated. They give more power with less gasoline consumption than any other engine.

It's easy to get just the right engine for your particular needs because they are made in all styles and sizes—1 to 45-H. P.; vertical or horizontal—stationary, portable, or traction.

Call on the I H C local dealer, tell him of the work you want to do and let him show you the one for your needs. If you have feed to grind, milk to separate, wood to saw, fanning mill to operate, an engine from this line will meet your needs. Remember—the efficiency of I H C Gasoline Engines has been proved by years of service—they are backed by a company that has a reputation to maintain and could not afford to put out any machine that is not dependable.

IHC Service Bureau

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizer, etc., write to the I H C Service Bureau, and learn what our experts and others have found out concerning those subjects.

If you want the I H C Gasoline Engine Catalogue to aid you in your selection, ask the I H C local dealer for it, or, write the nearest branch house.

Estimates and Plans Furnished.

tion and valuation of the nation's coal fields is immense and the scheme under which it has been worked out is remarkably accurate and scientific. The best evidence of its accuracy is the ready acceptance of the estimates and valuations by purchasers of coal lands and the fact that the Geological Survey is constantly receiving applications and petitions for the classification of coal lands.

Enormous Tract of Coal Land.

As a result of geologic field examinations this administration has also withdrawn 62,140,548 acres of probable coal land and has restored to agricultural entry 18,777,756 acres of noncoal land, which had been withdrawn from entry pending the Geological Survey's determination of its character. A single Montana withdrawal, made last July, included 20,208,865 acres. The amount of coal contained in this area is almost incredibly great. A single 40-acre tract, for example, contains over two and a half million tons of coal. The present outstanding withdrawals awaiting geologic classification aggregate 80,007,688 acres.

Large Withdrawals of Oil Land.

Another public fuel resource in the conservation of which the administration is taking an active interest is oil. Many of the public-land states are underlain by deposits of petroleum, with which natural gas is frequently associated. Two years ago the Geological Survey reported to the National Conservation Commission that the oil contained in the California deposits alone amounted to eight and a half billion barrels, and this estimate is now declared to be moderate. Careful geologic examination has been made of the western oil fields, and 3,796,572 acres of public oil land have been withdrawn from entry in California, Oregon, Wyoming, Utah, New Mexico, Colorado, and Louisiana. These withdrawals are made in aid of proposed legislation, for the present gold-placer law under which oil or gas land must be acquired is absurdly inadequate and provides no means by which the government can retain an oil supply for the navy, every new ship of which is now equipped with oil-burning furnaces.

Conserving Water Powers.

Withdrawals of waterpower sites on public lands by the Geological Survey in aid of proposed legislation have included thousands of sites. The withdrawals made during the last two years cover 161 streams in 12 states and aggregate 1,403,054 acres.

Discoveries of Phosphate.

Even the classification of agricultural land in the West has devolved upon the Geological Survey, which during the last two years has designated 186,005,858 acres as nonirrigable and thus subject to entry under the enlarged homestead act.

The Geological Survey has contributed most notably to the farming interests in connection with the discovery and classification of phosphate lands. Phosphate is as necessary a plant food as potash. The world's supply of phosphate is small, but fortunately the largest known deposits have been recently discovered in the public land states of this country. As the result of careful geologic examination 2,548,145 acres of phosphate land are now withdrawn from entry awaiting legislation to safeguard them from monopoly, and another area recently discovered to be underlain with this mineral resource will soon be withdrawn. These lands include several areas discovered by survey geologists. The lands withdrawn are in Montana, Utah, Idaho, Wyoming and Florida.

Mineral Land Now Withdrawn.

The areas of public mineral lands of all kinds now withdrawn are given below, in acres:

Coal	80,007,688
Oil and gas	3,796,572
Water power	1,406,054
Phosphate	2,548,145

IRRIGATION INVESTIGATIONS.

The U. S. department of agriculture has just issued a progress report of co-operative irrigation investigations in California covering the ten-year period 1900-1910 which is available for free distribution on application to U. S. Irrigation Investigations, Berkeley, Cal., or the Secretary of Agriculture at Washington, D. C.

This report gives a summary of the irrigation work of the department of agriculture since 1900 in co-operation with the state of California, with a list and outline of all irrigation reports issued by the department or now in press.

One of the main portions of the report is a review of the water-right situation in California and of the efforts heretofore made to obtain irrigation legislation for California along the lines of that in force in the other irrigated states. A state commission for the preparation of an irrigation law for California is suggested.

The report is known as Circular 108 of the office of experiment stations and is entitled "Second Progress Report of Co-operative Irrigation Investigations in California."

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Chicken Pox.

I have several chickens eight weeks old with "pimples" as large as small peas all about the eyes and head. They seem to itch, as they rub their heads on other parts of their bodies. Have used lard, turpentine and carbolic acid in mixture. What is the trouble and cure?—Subscriber, Fowler.

This is a straight case of chicken pox. It is very contagious and fatal to young chicks. Grease the "pimples" with carbolic salve and if the mouth or throat is affected, a wash of vinegar and salt is good, a level teaspoonful in a cup of vinegar. Also swab throat with peroxide of hydrogen. A little germozone in drinking water is a preventive. Thoroughly disinfect premises with carbolic acid and water. Brooders should be scalded and sprayed, and if bichloride of mercury is added to the scalding water it is far better. It is a deadly poison. Of course, all feeding troughs and drinking vessels must be thoroughly disinfected. Another remedy is use of strong soap suds in which is mixed a little carbolic acid. After washing heads, anoint sores with vaseline and fresh lard.

Lice.

I have 160 White Leghorns badly infested with lice. What is the best way to get rid of them? Is it advisable to dip hens in solution of kerosene?—C. S. E., Ceres.

The poultry department of this week contains condensation of report of the Maine Experiment Station, part of which has been given in the Cultivator before. It is an excellent treatment and has been highly recommended by those who have tested it. In addition we may say that one of the very best remedies is a good dust bath before poultry at all times. It may be of freshly turned earth, mellow and slightly damp. It is well if out of doors to have under a tree, or it may be inside in a box six or eight inches deep. If hens are badly infested now it is well to dust with good lice powder. Any good poultry supply house will carry several excellent powders, or common road dust may be used, to two quarts of which four fluid ounces of any good lice killer may be added and thoroughly mixed, then add tobacco dust bulk for bulk.

Best Cherry Root.

Which is the better stock for cherries in California orchards, Mazzard or Mahaleb?—Subscriber, San Luis Obispo.

It is the general experience among California cherry growers that Mazzard is the best stock for cherries in this state.—J. W. M.

Right of Way.

A had a piece of land (forty-three acres), which he rented to B for ten years, and a flatiron-shaped piece of ground, 10x15 feet, between A's line at creek and county road belongs to B. B made this crossing in to county road across this flatiron-shaped piece of land, 10x15 feet, himself, while he had it rented, and it has been used as an opening to A's piece of land into the county road, now, nearly thirteen years. C bought this forty-three acres from A nearly three years ago, and has been using same crossing. B let C put in culvert in creek (4x6 feet), and also swing gate at county road. Can B make C pay for this piece of land, 10x15 feet, now, after it being used for an outlet for thirteen years, or can B stop C from crossing this flatiron-shaped piece (10 x15 feet) to get in to county road?—A Subscriber.

As C has only used the outlet for three years, and put in culvert and swinging gate under permission from B, I conclude that C's use of the road is merely permissive on B's part and in the nature of a license, and therefore that C has acquired no rights, nor would he acquire any, even though the statutory period should elapse, so long as he continues to use merely under a license or permission. The years of use by B and those who desired access to B's land, while B was in occupation of the forty-three acres, would not be considered in solving the question, unless, also during that time, C, or the public generally, had used the right-of-way under a claim of right as a public way. Under the facts given, I see no reason why B cannot stop travel on the strip at any time.—E. L. P.

Hop Vines.

How are hop vines started and where can I get some, a few plants which will make good shade?—Subscriber, Terra Bella, Tulare county.

We do not think the climatic conditions of Terra Bella would be ideal for hops. The effort may be worth the trial however. They like rich, sandy loam and should be protected from strong winds. They are always propagated from cuttings of the underground stems called roots, taken from runners of established hills. If they are simply wanted for shade, we believe quicker results could be secured by the use of the common morning glory, or better, the kudzu vine which is one of the most rapid growing vines known.

Stock for Citrus Trees.

Which is the better stock for oranges, sweet or sour, and why?—Subscriber, Santa Ana.

We presume the greater proportion of the citrus trees in California are on sweet stock, but the sour is now more used than formerly and is especially desirable on heavy, moist lands. It has stronger and more extensive root system and is far less subject to gum disease.

Dip for Scabby Potatoes.

Please give best formula for dip to prevent scab on potatoes.—Subscriber.

See Cultivator of November 3rd for formulas, one of which is for formalin as follows: formalin one ounce, water two gallons. Immerse whole tubers for an hour and a half.

Lespedeza Grass.

Is the lespedeza grass grown in southern states desirable for this state? Am told it will crowd out Bermuda. Is it good for hay? How many crops are obtained?—Subscriber, Modesto.

This is an annual forage plant, widely branched and decumbent, though it may be erect where crowded. Grass is from three inches to two or more feet in height. It is often called Japanese clover and supposed to have been introduced from China or Japan into the southern states where it has been under observation since 1849, growing especially well along the Gulf. It will hold its own against all weeds and it is claimed that it will crowd out Bermuda, but is itself much more easily eradicated under culture than is Ber-

muda. It is not very exacting as to soil, but does best on moist loam, though it will not stand a wet soil. It is not often sown, as it spreads naturally. It is said to afford valuable pasturage for cattle, horses, hogs or sheep though they must learn to like it. It is used extensively on the poorer clay soils of the cotton belt. It will not stand frost and is not grown in the North. It is sometimes harvested for hay and must be cut while green, that is, it should not be overripe. It has produced as high as three tons to the acre. We do not know of its culture in California but from the amount of moisture it requires, assume that alfalfa would be vastly superior.

Hoop Snake.

Please give information regarding hoop snakes. Do they form a hoop when chasing people, and do they sting or bite?—J. W. P., Yuba City.

The hoop snake is perfectly harmless, a native of the southern part of the United States. Its scientific name is Abaster erythogramnus. The name "hoop snake" was given it because of the mistaken impression that it forms itself into a hoop by taking its tail in its mouth and rolling with great velocity. This impression was no doubt gained by its undulation when in rapid motion.

Gum Disease.

We have two inquiries concerning gum disease, and refer for answer to citrus page of next issue where appears the address of Mr. A. F. Call of Corona made before the citrus growers' convention at Pomona some months ago. Mr. Call has fully investigated this trouble and gives in this address treatment for it.

Changing Drakes.

We have Indian Runner ducks which have been penned with Pekin drake. We now have Indian Runner drake. How long before the Pekin strain will have disappeared and the eggs hatch full Indian Runners?—Subscriber, Santa Rosa.

Definite information cannot be given as to length of time; probably two weeks. Some think that the entire clutch of eggs must be laid out; others think it is only a matter of two or three days. We may add, however, that believers in telegony, or permament influence, claim that once a cross has been made there will always be an influence on the offspring. This belief has been strong with breeders of dogs, but Davenport's Principles of Breeding maintains that positive proof of this so-called principle has never been made.

Government Lands.

The Cultivator recently made mention of the fact that 36,000 acres of government land in Stanislaus, Merced and Mariposa counties was to be opened for settlement on April 9 and subject to entry on and after May 19. The officer having jurisdiction over this land is Receiver J. C. Ing, U. S. Land Office, Sacramento.

Standard on Indian Runners.

Can you tell me what the Standard of Perfection requires of Indian Runner drakes?—Old Subscriber, Santa Rosa.

Weight: 4½ pounds. Head: Long, flat, finely formed, fawn and white, the fawn in head darker than in rest of body. A narrow line of white divides the cap from the cheek markings behind the eyes, and a line of white about one-eighth of an inch divides the base of the bill from head markings. Bill: Strong at base, fairly broad and long, extending down from the skull in a straight line, giving appearance of long wedge, yellow when young; greenish yellow when fully developed, with black bean. Eyes: Set high in head, dark brown. Neck: Long and thin, white from head to where breast markings begin, which should be about one and one-half to two inches above base of neck. Wings: Medium length, carried close to body; shoulder and top part same color as breast. Primaries and secondaries white. White of primaries and secondaries should extend up the lower edge of wings to a point a little above the white of lower part of body, forming an inverted V-shaped marking on each side of the body. The fawn on shoulder, top part of wings, when wings are folded, comes to a point on lower part of back, forming a heart shape, like heart pressed flat on the back. Tail: Composed of hard, stiff feathers; sex feathers hard, well curled, bronze green. Back: Long, narrow, even fawn colored throughout. Breast: Full, but not rounded, showing little suggestion of keel. Carried well up. Fawn and white, divided about half way between point of breast bone and legs; upper half fawn, lower white. Body: Long, narrow, racy looking, carried erectly, with no indication of keel, resembling penguin in form. Body and fluff are white except an indistinct line of color which runs from base of tail to thigh. Toes and legs of medium length, set well apart. Toes straight, connected by web, orange red in color.

Veterinary

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Nasal Discharge.

I have a sick horse, which does not eat well and has a running from the head. The discharge has a foul odor. Will other horses on the farm take the disease and can you give a remedy?—Subscriber, San Jose.

From the meager description it is impossible to determine if the horse has catarrh of the cavities of the head or a disease of the entire system. Open the nostrils and examine the partition of the nose for ulcers. Have swellings appeared in the body or legs during the past few weeks? Have there been sores on the legs? If so, this may be a disease which the other horses may contract. If not, have the teeth (the upper grinders) examined for a diseased tooth which may cause a foul discharge from the nose. In any event the horse will require the services of a qualified veterinarian.

Pink Eye?

Friday evening my horse showed uneasiness, eyes pink around the edges, and eyelids swollen. By Sunday the eyes have changed to a white color. He has good oat hay, rolled barley and grass, eats fairly well but slowly. Is this pink eye? Please give cause and remedy.—Subscriber, Oceanside.

The symptoms do not correspond to either pink eye or moon blindness. In the former, milky discoloration is rare and the latter disease is seldom encountered in this climate, and as a rule, one eye only is affected at a time. Dissolve ½ drachm boric acid and 2 grains morphine in 2 ounces of camphor water and apply a little to the eyeball two or three times daily with a feather or soft brush. Supply drinking water in a bucket adding one tablespoonful of epsom salts to each gallon of water.

FRUCTIFICATION OF THE FIG BY BLASTOPHAGA.

(Continued from Page 419.)

sands of plants were grown at the United States Introduction Garden at Chico. It is believed that such plants will be the means of producing some interesting varieties. The breeder does not have to wait long for results, for most of the seedlings bear fruit at the age of two and three years.

A striking instance of the fertilization of common figs occurred last year at Loomis, Placer county, where a fruit grower had grafted a portion of an Adriatic tree with Smyrna scions. The Smyrna branches set quantities of figs, and, wishing to secure a crop, the owner hung caprifigs in them containing blastophaga ready to issue. Some of the wasps entered the Adriatic figs on the ungrafted part of the tree. The writer secured three matured Adriatic figs which showed by their larger size that they had been entered by the wasps. These three figs contained, by actual count, 4,800 heavy, fertile seeds, or an average of 1,600 for each fig—certainly a good crop from a "mule fig" which, according to some writers, will not breed.

In this way fertile seeds can be secured from all kinds of our cultivated figs, and the breeder has complete control of such crosses, and can with considerable confidence expect to perpetuate desirable hereditary characteristics in his seedling trees. It is found, however, from experience that about one-half of such seedlings are staminate trees. The process is exceedingly simple. A twig is selected with a number of figs from three-eighths to three-quarters of an inch in diameter, which is the receptive size in most varieties. Drop a caprifig with blastophaga ready to issue into a paper bag and tie it tightly over the twig, and the insect will do the rest. At the end of two or three weeks remove the paper bag and replace with one of mosquito netting, for protection against birds and to prevent the ripe dried fig from falling to the ground.

Caprifig Seeds.

The mammoni crop of the capri tree is the only one which has been observed to produce seeds, and then only in small numbers. The obvious reason is that it is pollinated by the blastophaga of the preceding profichi crop. The profichi itself yields no seed, because the mamme figs preceding it have no pollen, although the pistils are provided with receptive stigmas.

Solms-Laubach found twenty seeds in forty mammoni figs, and reached the conclusion that not more than one flower in 2,000 was a perfect female flower, all the others being gall flowers, incapable of fertilization. The writer has found as many as seventy-five fertile seeds in one fig, and from a large number of mammoni seeds secured last summer young plants are now being grown at Chico. From careful observations the writer has been forced to the conclusion that all gall flowers are perfect female flowers and susceptible of pollination, and that most of them are pollinated, but if the blastophaga deposits an egg in the ovary, the resulting larva would prevent the formation of the embryo, and if formed would be eaten or otherwise destroyed. The seeds therefore found in the mammoni figs are from those flowers in which the insect failed to oviposit.

There seems to be some connection, not yet well understood, between the seed and the secretion of sugar and coloring matter. The pedicels and floral envelopes of the seeds in the mammoni fig are succulent, sweet, and generally of a pink color, while all parts of the gall flowers containing blastophaga are white and quite dry, the difference in appearance being so great that the seeds can be readily picked out with a pair of forceps from the mass of galls by their juiciness and color.

As further evidence that all the flowers in the mammoni fig are perfect female flowers, some of the persistent styles were taken from fertile seeds and others from galls containing fully developed blastophaga in the same fig, and placed side by side under the microscope, and were found to be identical in cellular structure and in every respect. The writer is therefore satisfied that the stigmas of the caprifigs are equally as susceptible to pollination as are those of the female figs, and, in fact, are so pollinated, but fail to produce more than a few seeds for the reason given.

When the blastophaga enters the caprifig its stamens are in an undeveloped condition, and will not be ready to shed their pollen until about two months later, that is, at the time when the next generation of wasps is ready to issue. It is therefore impossible for a fig to pollinate itself. Here, then, is a striking instance of one of nature's methods of preventing self-fecundation.

Life of the Blastophaga.

The beneficent insect upon which depends absolutely the whole Smyrna fig industry was sent over to the United States from Northern Africa in 1899 by Mr. Walter T. Swingle of the Bureau of Plant Industry of the United States Department of Agriculture. He succeeded where others had often failed by confining his efforts to the winter generation and by the ingenious expedient of wrapping each caprifig in tinfoil to prevent evaporation. Mr. Swingle is entitled to full credit for his successful efforts, notwithstanding the fact that the blastophaga was already here, having been accidentally introduced with fig trees from the south of Europe about 1865, but not known to orchardists until about three years ago, having been confined to an isolated tree ten miles west of Modesto.

In April, in the warm valleys of California, the wasp which hibernated in the larval form during the previous few months reaches maturity. The male leaves the gall first. He moves about the interior of the fig, and, finding a gall containing a female, gnaws a hole through the cortex at the base of the style, and, inserting his long, slim abdominal projection, fertilizes the female while still in the gall. The female enlarges the opening, and sometimes makes another, always at the base of the style, probably because it is the point of least resistance. In from twenty-two to forty-eight hours she comes out, reaching the open air through the cluster of male flowers, the anthers of which at this time have burst and are shedding large quantities of pollen. She is frequently so loaded that she is unable to fly until she divests herself of much of it in the same way that the common house fly cleans itself. After being relieved of part of the load, she flies to the nearest fig, and, if found to her liking, immediately seeks the opening at the apex. At this time the figs are hard and from a quarter to three-quarters of an inch in diameter, and the eye is closed by the overlapping scales. With her powerful mandibles she sometimes is obliged to cut away a portion of one of them to effect an entrance, but usually she is able to push her head in, and after a struggle of sometimes five minutes or more pushes her body down the zigzag way to the interior of the fig, leaving her wings behind.

While one wasp is probably sufficient to fertilize a fig, where they are very abundant, as at the Maslin orchard at Loomis, it is not unusual to find a dozen or fifteen in one small fig, and as many more in a struggling mass trying to get in, the cluster of wings radiating from the eye like the plumes of a feather duster. If the caprifig from which the wasp has issued has been hung in a Smyrna tree, she enters a Smyrna fig, and then finds she has made a mistake, as the flowers are of such shape that she cannot oviposit in them, and after wandering about in a vain effort to dispose of her eggs, in this way doing her useful work of fertilizing the female flowers, in most cases crawls out. When the weather is warm, say 90 to 100 degrees, the insects are very active, and come out of the caprifig with a rush. The writer has seen forty come out in one minute. The issue takes place almost entirely in the forenoon, except a cold, windy morning is succeeded by hot sun in the early afternoon, then a considerable number issue. The movement depends much upon the weather. During cool, windy mornings very few come out, but if the next morning is warm, calm and sunny, a great rush occurs. The wasps continue to issue from a single fig for a week or ten days, and from various trees for two to three weeks. After the females have left the fig, most of the males soon follow, and, being wingless, drop to the ground like the females from the Smyrna figs.

Every Smyrna fig not entered by the blastophaga dries up and falls from the tree. The same is true of the caprifig. In a few days the caprified fig undergoes a remarkable change. It begins to increase remarkably in size, becomes smooth by a lessened prominence of the ribs, and, losing its pea-green color, assumes a decidedly pruinose tinge, this being true also of the caprifig.

There are still obscure problems to be solved in connection with the fructification of the fig, and it would be gratifying if some of our skilled cytologists could be interested. One such problem is to determine why the first crop of certain figs reaches an edible condition without caprification, while the next one never matures without it. One of these varieties is the White San Pedro, and another is the Gentile. The first crop of the latter, however, does not entirely fail without pollination, but the crop is much increased by the application of the blastophaga.

Outlook for the Fig Industry.

The outlook for the Smyrna fig industry in California is extremely promising, due principally to favorable climatic conditions, and it is rapidly spreading to all parts of the great interior valley. The climate is not at all inferior to that of the Smyrna district of Asia Minor, where the bulk of the finest figs of the world are now produced. The Valley of the Meander, the seat of the great Smyrna fig industry, has a much moister climate and in some respects inferior to that of portions of California. The rainfall is three or four times greater than that of the central San Joaquin Valley in this state, where the industry has at present its greatest development. The rain, however, falls mostly from November to April, with occasional showers and dew in summer, making irrigation unnecessary. One drawback in that country is that once in three or four years a frost occurs which is severe enough to destroy the caprifigs, when the growers are obliged to draw supplies from the frost-free islands of the Mediterranean.

The ideal climate for Smyrna fig culture is one in which the winters are mild enough to permit the blastophaga to live through without injury and with freedom from early rainfalls. The Smyrna figs ripen and dry on the tree in September, October and November, and then fall to the ground, only the largest requiring further exposure to the sun. Dry weather at this period is therefore indispensable. As these conditions prevail nowhere else in the United States, except in California and a part of Southern Arizona, these would seem to be the regions in which the industry will have its greatest development.

DWARF MILO MAIZE
A DRY LAND CROP

Where the rainfall is limited or water is expensive there is no more profitable forage and dry feed crop than **Milo Maize.** It belongs to the sorghum family of tropical Asia and Africa, where it is the principal grain grown.

We have secured a stock of a dwarf variety that has been thoroughly tested in Southern California and Arizona, yielding two and one half tons of grain per acre. It grows a stalk 4 to 5 feet high with large, compact, erect heads, and stock especially like the sweet flavor of the stalk.

Anaheim, Cal.

Timely Ranch Suggestions

THE OUTLOOK FOR 1911.

By M. R. D. Owings, of the I. H. C. Service Bureau.

The year just closed will be memorable for the enormous value of its agricultural products. Never before in the world's history has the United States produced farm products to the value of $8,926,000,000 in one year, which is the value of the argicultural products of this country for 1910, as reported by the Secretary of Agriculture. This aggregate is nearly double the value of the crops of 1899—an increase in eleven years of nearly $4,500,000,000—and this prosperity of the farmers is practically nation wide, as almost every crop and every district, except some portions of the Northwest, have participated in bounteous harvests. Indeed, this prosperity of the farmers is nearly world wide, and as a result, in part at least, trade expansion in 1910 was larger than in any other years.

But the record of business for 1910 is now closed, and we are concerned more particularly with the new year. We refer in passing to the crop results in 1910 only because of the fact that this prosperity of the farming community furnishes a most substantial reason for the expectation that the new year may be a very prosperous one for the people of the United States.

Much has been said of late concerning the necessity for better cultivation of the soil and of increasing the yield per acre, if we would keep pace in our production with the increase in our population, and thus preserve our position as a food-exporting nation. The agitation in this direction is resulting in the use of more and better implements and machines for the cultivation of the soil, and less wastefulness in harvesting the crops. Many of the state agricultural colleges are sending their professors out among the farmers, giving lectures and demonstrations, directing attention to the importance of selecting good seed, the best methods of tillage, and the proper steps to take to maintain and increase the fertility of the soil, and this work is supplemented with educational booklets and special articles prepared and sent out by the leading manufacturers.

The effect of this is seen in a more general use of the most modern tillage implements — traction engines for deeper plowing, to get beneath the earth that has been compacted by years of plowing a uniform depth, and thus increase the depth of the loose soil and its capacity for holding moisture; corn binders and huskers and shredders for saving the corn crop; gasoline engines for pumping and other uses on the farm, etc. The farmer is realizing in a larger way the value of these machines, and the bumper crops give him the means with which to procure them. The profitable crops also emphasize the necessity for the use of the best farming implements and machines in order that the largest returns possible may be realized from each acre.

We have also heard considerable of late about the "back to the farm" movement from the big cities. Many who have found the struggle too strenuous in the overcrowded centers of population, and desire the freedom and independence of the farmer, are returning to the simple life. All these things make for a larger and better demand for the commodities of trade, and give a substantial foundation for the belief that the demand for farm products in 1911 should be considerably more active than in any previous year.

RAILROAD ENCOURAGES GOOD ROADS.

Unique among the efforts of the Pennsylvania railroad to encourage the good roads movement in the state of Pennsylvania was the operation of a good roads educational train in January. This was the first time any eastern railroad has run a good roads special.

The train was in charge of the Pennsylvania State College co-operating with the roads department of the national government and the state highway department of Pennsylvania. The train, consisting of four cars, was used for lecture purposes in villages and small towns along the lines of the railroad. One car was fitted up with a lantern for the illustration of the lectures, another car for exhibits showing models of several types of roads such as earth, sand-clay, gravel, macadam, and telford. This car also contains series of photographs and drawings for illustrating the different methods of drainage and kinds of construction required for special conditions. Two flat cars contain samples of the most important machinery required for service in road building, also a home-made roller, drag, and sprinkling wagon. The exact cost and methods of construction of the roller and drag will be shown in detail.

The Pennsylvania railroad has for some time been conducting a campaign in the interests of good roads. Literature has been disseminated and lectures have been given in a number of towns. The railroad company hopes to carry the gospel of road building into every section of the state.

The state's experts on good roads say that "the average cost per ton mile of hauling over the ordinary dirt roads is twenty-five cents. It has also been proved that a very large saving can be made in this item at a comparatively small cost for proper drainage and preparation of the roads. As 92 per cent of the roads of the United States are made of dirt, it is evident that an improvement in this direction is well worth consideration. In fact, careful calculations have shown that the country could be saved an actual expenditure of over $100,000,000 per year if the roads were of first-class construction and suitably maintained."

The state department men say that many thousands of dollars are thrown away annually on account of failure to maintain roads which cost large sums to build and which through neglect have rapidly deteriorated to a condition where they must be wholly rebuilt.

THE BLOSSOMS ON THE TREES.

Blossoms crimson, white or blue,
Purple, pink and every hue,
From sunny skies to tintings drowned
In dusky drops of dew,
I praise you all, wherever found,
And love you through and through—
But blossoms on the trees,
With your breath upon the breeze,
There's nothing all the world around
That's half as sweet as you!

—James Whitcomb Riley.

WHY FARMERS NEED AUTOS.

I was asked the other day what I considered the most important accomplishment of the motor car.

Of course, the greatest thing accomplished by the motor car has been the improvement of individual transportation. That is the greatest general need the motor car has accomplished.

But the greatest good which has resulted from the automobile has been to the farmer. The motor car has undoubtedly accomplished wonderful things in the development of cities. It has done great things in taking city people into the country. It has done great things for commerce and cities, but no one has benefited so greatly from it as has the farmer.

I have lived on a farm myself; and I believe that the farmer really needs the motor car more than any other class of autommobile buyers.

In the first place the very nature of the farmer's business compels him to live a more or less isolated existence. He can not pick and choose his society. He must go where the land is most productive, and that is usually somewhat remote from social and business centers, from railroads and from other farmers. In the years gone by unless a farmer lived within a very few miles of his market, "going to town" was quite an event. All of us who have been in the country at all can remember how the lumber wagon used to be filled with butter, eggs, vegetables, a couple of bags of wheat and a bag of shelled corn for the mill and such other things as we had to sell—possibly a calf or a nice fat porker. Mother and father rode in the spring seat up in front. The children sat on boards laid across the wagon box or rode on the sacks of wheat. Then the whole family sat and boiled in the sun and were partially suffocated by the dust kicked up by "Dolly" and old "Bob" during the fortnightly or monthly trip to town.

But the day of that sort of thing has passed. The modern farmer has too large interests to plod along behind "Dolly" and old "Bob," faithful as they were. This is the age of speed. Men and events move rapidly. The agricultural districts of today have replaced the wild places of yesterday. The farmer who keeps abreast of the times watches the market and turns over his crops when he can make the greatest profit. He does not devote large portions of his farm land and a great deal of his time to the cultivation of little things. He specializes and buys the necessaries of life in the cities. He has real need for the automobile which carries him to the city in one-third the time he used to spend. The motor car has enabled him to carry his products to the best market; not merely to the nearest town. The motor car has made it possible for the farmer to have all of the comforts of life of the city while still enjoying all of the advantages of the country.

The automobile has done something more than all this for the farmer, though the benefits are along less practical lines. The automobile has brought the farmer nearer to his neighbors. It has relieved that deadly monotony of ilfe in an isolated district. Farmers who live twenty miles apart are made next door neighbors by the motor car.—Ex.

AS A REMINDER.

His Wife: John, do you remember what took place just three years ago today?

Her Husband: What! Is this our wedding anniversary?

His Wife: N-no. Three years ago today you bought me a new hat.—Harper's Bazar.

Tires 10% Oversize

25% More Mileage—No Extra Cost

If you buy tires for an automobile, let us explain how to cut the cost half—as tens of thousands are doing.

The tires which we tell of—Goodyear No-Rim-Cut tires—are now the sensation of motordom.

Last year our tire sales trebled—jumped to $8,500,000 — because we controlled these tires.

This year 64 leading motor car makers have contracted for them. They outsell our clincher tires six to one.

And these are the reasons:

No Overloading

About 25 per cent of the average tire cost is due to overloading.

The tire size is adapted to the car when stripped. But when you add extras—top, glass front, gas tank, extra tire, etc.—the tires have too much weight. And you overload them otherwise frequently.

The result is a blowout.

Goodyear No-Rim-Cut tires, to take care of these extras, are made 10 per cent oversize. The rim flanges flare outward when you use this tire, so this extra size is possible.

We supply this extra size at no extra cost. That means 10 per cent more air, and air carries the load. It means 10 per cent greater carrying capacity. It means, with the average car, 25 per cent additional mileage per tire.

You get the same result as though you paid for a 10 per cent larger tire.

No Rim-Cutting

Then these patented tires end the damage of rim-cutting. Other tires are ruined when you run them flat. Rim-cutting, on the average, adds one-fourth to one's tire bills.

Note the picture below.

The No-Rim-Cut Tire

This tire is fitted on a Universal rim—the standard rim now adopted by nearly all motor car makers. But the tire fits any rim.

The removable rim flanges are simply set to turn outward, instead of inward, as with the old-type tires.

The tire, when deflated, comes against a rounded edge. You can see why rim-cutting never occurs.

Ordinary Clincher Tire

With ordinary tires these removable rim flanges are set to curve inward, to grasp hold of the hooks in the tire. That's how the tire is held on.

Note how those thin edges dig into the tire. That is what ruins a tire—in a moment—when puncture makes it flat.

How We Avoid It

In the base of our tire we vulcanize 126 braided wires. That makes the tire base unstretchable. It can't be stretched over the rim flange—can't be forced off—until you remove the flange.

When this tire is inflated the braided wires contract. The tire is then held to the rim by a pressure of 134 pounds to the inch.

That's why the hooks are unnecessary. That's why the rim flanges don't need to dig into the tire.

This feature is controlled by our patents. And there is no other feature ever invented which makes a practical tire of this sort.

Tire Book Free

We have sold enough of these tires to equip over 100,000 cars. The demand has become overwhelming. You should know the reasons if you own a car.

They are told and pictured in our Tire book in a clear, convincing way. Let us mail it to you. Write us a postal for it.

You will insist on tires which cut upkeep cost half when you know the facts about them.

Did You Ever Stop to Think

That only a very foolish person will try to cut tree limbs with manicuring scissors

—— ALSO ——

That the lightest looking mower is very apt to cut heaviest?

THE NEW STANDARD MOWER

All power in a Mower originates from the grip of the wheels on the ground—the firmer the grip, the greater the cutting power.

The 5-foot New Standard Mower weighs 825 pounds. The entire weight of the cutting bar (while cutting) is transferred through the suspension spring to the main wheels. The bar is neither pulled nor pushed,—it is carried—an exclusive Standard feature.

The power thus secured is transferred to the gearing through the mechanically perfect wheels, found only on the New Standard Mower. The gearing develops high speed without undue strain and passes the power to the knife. The knife works in our famous curved Cutter Bar—straight when lowered—the only frictionless knife channel made.

These are a few reasons why the New Standard Mower is the most powerful cutting mower made. There are other reasons just as interesting.

A folder giving full detailed description of the New Standard Mower and our other Haying Tools will be mailed free on application.

R. D. No. 6, Santa Ana, Cal.,
February 13th, 1911.

The California Cultivator,
115 No. Broadway, Los Angeles, Cal.

Gentlemen: It may be of interest to you to know that the small liner which I recently inserted for one issue in your paper (as per clipping above attached) has brought to me returns to the amount of $386.50. More than one-half of this came to me from the central and northern part of the State. I have been compelled to return to correspondents $48.00 because of the impossibility of filling some of their orders at the exact time desired. You can see from the above that this has been a profitable advertising proposition for me.

Very truly yours,
W. D. ROSE.

And sold stock and eggs to the the amount of $386.50

FARM LANDS FOR SALE.

For Sale—50 to 200 acres, $27.00 per acre, irrigated land; 1-3 cash, balance easy terms. My ranch of two hundred acres can be had on above terms. I will guarantee your expenses in writing if you go and see this property and do not find it to be all level land, good rich soil (free from alkali and hardpan). Water right goes with land and all ditches to the land are complete and paid for. This property is located in the Yaqui Valley, Sonora, Mexico. All adjoining property owned by Americans. Hotels, stores, warehouses run by Americans. Two hours' drive to the ocean. Good markets, two full crops yearly. You can earn over $50 per acre net profit yearly on this land and can grow anything you know how to plant. Address Box "O," Cultivator.

For Sale—$3,500—80 acres, fenced, 5 acres Eucalyptus trees. All under cultivation. School ¼ mile, 4¾ miles from Santa Maria.

$2,800—40 acres, fenced, all under cultivation. School twenty rods, 4½ miles from Santa Maria.

$2,000—32 acres, fenced. Small house, barn, windmill, tank, soft water. School and town of Orcutt 1 mile.

$3,500—40 acres, fenced. House 4 rooms and kitchen, windmill, tank, soft water, barn, chicken houses; ¾ mile from Orcutt.

Terms given by owner of all above property. H. D. Toy, Box 222, Santa Maria, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

Perris Valley—160 acres at Box Springs, four miles from Riverside; Santa Fe road through land. Good citrus fruit land, now in grain, and fine subdivision proposition. Reduced from $100 per acre to $50 for quick sale. Non-resident owner. Snap. Devendorf-Caldwell Co., 630 Central Bldg., Los Angeles.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

For Sale—Orange land in small tracts in Exeter district. Large tract of level, fenced, pasture land. Plenty water. Part cash, terms. Apply Fred M. Hart, Exeter, Cal.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Tulare County Alfalfa Land—8000 acres in any size tracts, artesian water. Opening sale from $30 to $60. Easy terms. To the first man who will immediately improve will allow him his own time to pay for his land. Thomson & Rupp, 322 West 6th St., Los Angeles.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

If you want an orange grove or ranch of any description it will be to your advantage to see me. I have some of the best buys in Southern California. John W. Shepardson, 215 Katz Building, San Bernardino, Cal.

DAIRY SUPPLIES.

The Goodacre Strains—Send for our new mating list with illustrations of Goodacre Quality Buff Orpingtons; R. I. Reds; White Leghorns; Anconas; White Runner ducks. Goodacre Bros., Compton, Cal.

S. C. Brown Leghorn Baby Bhicks, April 20th, $7.50 per 50 or $15 per 100. Mrs. C. H. Vary, Pomona, Cal.

Ancona Eggs for Hatching—Extra good stock. Eggs, $2.50 and $2.00 per setting of 15. Also White Mammoth Pekin Duck eggs $1.00 for eleven. C. S. Norton, Corning, Cal.

BONNELL'S S. C. BLACK MINORCAS
WIN EVERY TIME

At Los Angeles Show, 1911, every first premium and three silver cups; 2 specials for best male and female. Eggs $5 and $3 per setting. C. C. Bonnell, 2919 Brighton Ave., Los Angeles.

White Leghorn Baby Chicks—Don't try to raise cheap stock chicks. Our stock is all A1, on free range. Jan. and Feb. delivery 12½c, March 10c, April and May 9c. Livermore Hatchery, Livermore, Cal.

Rhode Island Reds—Eggs for hatching from high grade stock. Also some very choice cockerels, cheap considering quality. Write for prices. Frank Greenleaf, Greenleaf St., Santa Ana, Cal.

Baby Chicks—White and Barred Rocks, White Leghorns and Black Minorcas. Eggs from my own hens, and incubated right. They will live and grow. J. W. Lyon, R. D. 1, Gardena, Cal.

POULTRY

Lasher's Hatchery, 15 Kent St. Petaluma, Cal.—Why my chicks live and grow in the hands of my customers, they are all hatched from free range stock, bred right, mated right, fed right. I have the most up-to-date hatchery building in the country, built of brick, with dead-air space in wall, giving me a uniform heat that means strong, healthy chicks; 16 years in the hatching business, 10 years at present stand. It is no experiment or guesswork with me. Prices per 100, White Leghorn, $7.25 and $8.50. Leghorn-Minorca cross, $7.25. Black Minorca, $10.00. Terms, cash with order.

White Orpington and White Wyandotte eggs for hatching. My winnings at Los Angeles 1911 were 1st cock, 1st hen, 1st and 2nd cockerel and 1st pullet on White Wyandottes. White Orpingtons, 1st, 3rd, 4th and 5th pullets, and 2nd and 4th hens. I breed my winners and am up to date in mating for results. I have no other business. Eggs sell at $3.00 and $5.00 per 15. No more stock until May 15th, when I will sell part of my breeders. Order direct from this ad and your order will receive my most careful attention. A. W. Huskins, 713 Waterloo St., Los Angeles, Cal.

Jubilee Orpingtons—Just received from Wm. H. Cook, England, a pen of Jubilee Orpingtons. Will have only a limited number of settings for sale. These are the best that England can produce. F. S. Washburn, Direct Importer, 240 Anita Street, San Jose, Cal.

Overcrowded; will sacrifice a few splendid White Rock roosters, 20 months old, fine breeders, $5.00 apiece while they last; also 6 hens, 20 months old, for $10.00. Write Dr. T. J. DeVaughn, 30 N. First St., Alhambra, Cal.

White Wyandotte Eggs for Sale—From good strong, large, vigorous stock. My birds are pure white and typical Wyandotte shape. Price per setting of 15, $2.00; per 100, $9.00. All eggs carefully packed for shipment. M. B. Patton, 1124 Brent Ave., So. Pasadena, Cal.

Mammoth White Holland Turkey Eggs, $5.00 per 13. No better stock anywhere. A. H. Blakely, Ontario, Cal.

Business

NEW PROCESS OF FRUIT DRYING.

What is probably the greatest discovery in fruit preservation that has been made for a century has just come to be placed into practical use. The law upon which this new process is founded is not new, but has been known for many years. It is the simple use of lateral heat as distinguished from vertical heat.

Lieut. Swett, the inventor, has spent many years of his life working upon the patent which he realized was attainable. Daily observation and a study of ancient methods of preservation convinced him that there was a law which was all powerful for the good of humanity and which could be brought to proper use by the right kind of apparatus.

It is distinctly opposite in its working and the results which have been attained along the lines of its work demonstrate that the old methods must give way to the practical utility of a very apparent, but little noticed physical law.

The process may be used in drying fruit, berries, vegetables, fish and meat. When placed in water they return to their original state, without the loss of a particle of their freshness, flavor or taste.

The tremendous benefit which the new process will be to the producer and the consumer cannot be stated in too large terms. It is a boon to the grower, a money saver to the consumer and a wealth producer to every user. It consists of a furnace in which use is made of the lateral heat units. With a furnace of this type the commercial dryer can give to his patrons a product which, when cooked, in every way resembles the fresh product. None of the delicious or health-giving qualities are lost. You can have your favorite fruit or vegetable at any time of year, regardless of the fact that at that particular time of year the market does not contain it in its natural condition.

It will mean that in the future just order a pound or two of the "Likfresh" product, prepare it as you would the same article in its natural condition, and you will have a freshly cooked food that will surprise the most skeptical. From the present state of development this invention bids fair to revolutionize the growing and drying industries of the United States, if not of the world.

The furnace may be seen in operation at Berkeley, near the Shattuck Hotel. Lieut. Swett is in attendance to give full particulars concerning his wonderful invention. See announcement on page 423 of this issue.

MONEY SAVERS.

Hawley, King & Co. have just received another consignment of the "Flour City" Gas Tractors. They have recently sold nine of these valuable adjuncts of farm work, and their customers are all well satisfied with them; they know that the engine is as near perfect as any engine on the market. The Hawley, King Co. want prospective customers to call and see them operate. They're money savers.

FROM SHELL TO MARKET.

The Coulson Poultry & Stock Food Co., of Petaluma, Cal., have just published a new book on poultry entitled, "Chickens; from Shell to Market."

This little book is tastefully gotten up, and though meant mainly for beginners, will be found of interest to all. It is free on application. We advise our readers not to be backward about applying for these booklets. A post card and a minute's time will do it.

The Farmers Ditch Irrigating Company of Santa Paula, Ventura county, held its annual meeting last Monday.

General Household Notes

THE REAL MAN WITH THE HOE.

Mr. Edward Berwick of Pacific Grove, takes exception to Markham's "Man With the Hoe," which appeared in a recent Cultivator, and sends the following which is his view of the real man with the hoe. It was written originally in 1899. We are glad to send it on again with a hope that it may prove an inspiration to some "braw boy" to develop his backbone or the stuff in him from which "sturdy presidents grow."

We're tired of the drool and the drivel,
  Lamentation, and mourning and woe,
Supercilious society's snivel
  Daily fired at the man with the hoe!

Bipeds such as the painter has pictured,
  And vast ink-shed has forced us to know,
May wear liv'ry of Gotham's "four hundred"
  Full as oft as they're found with the hoe.

Crowns have circled slant brows of such creatures;
  There are natures as bestial and low,
Demoniacs debasing God's features,
  In ranks that heap scorn on the hoe.

Such a man! such a hoe! stirs your pity
  Hoe and man are so surely "No Go!"
But you'll find just such men in your city
  Tho' they never set hand on a hoe.

The real man with the hoe isn't hunting
  Sham sentiment, maudlin and slow,
He's the man with true gun and bright bunting
  Who goes when his country bids "go!"

Boy in blue, he has ever been ready,
  When Columbia has needed a man,
To stand in staunch ranks, firm and steady,
  Or fire-tip fierce charge with the van.

This world's one relentless rude scrimmage
  Mad mortals a-muck for "the dough;"
But, when God planned a man in His Image
  He set him to work with the hoe.

Mother Earth can dispense with some classes,
  Brush-wielders, ink-slingers may go;
But she can't spare that friend of the masses,
  She must have the man with the hoe.

He's the "braw boy" our back-bone is built of,
  From his stock sturdy presidents grow;
Labor's King poets proudly may lilt of;
  Hurrah! for the man with the hoe!

EDWARD BERWICK.

Pacific Grove.

A PINK OF A HUSBAND.

"For a truth, Aunt Vina, Sylvia has a pink of a husband. I was there two weeks and never heard him speak a cross word, and he was as pleasant as could be to me," declared Lepha Morse to her Aunt Vina.

"It's a fact; he is a pink indeed," chimed in Lauretta. "I was there a week, and Susie was there three weeks, and he was so good to us; asked us to stay longer, and to come again. Actually, he made me eat three pieces of pie at one meal. Ha! ha!"

"And how about Sylvia?" asked Aunt Vina. "Is she a good housekeeper, wife and mother?"

"Oh, she is just working herself to death," declared Susie. "She works all the time, and never smiles nor talks much."

"Sylvia is not a bit like she used to be; she was so sociable and jolly; now she is sad looking, and frowns," said Lepha. "I tell you that she is not worthy of so good a husband as Ivan Everets, and little Elmer is such a fine child."

"And," concluded Lauretta, "Sylvia never as much as said 'Come again,' when we left there."

Aunt Vina closed her square mouth firmly and made no comments. Later she stated that she was going to see Sylvia.

"She won't thank you for your visit," said Lauretta.

"I'll go anyway," declared Aunt Vina, and she went.

Sylvia's parents had died when she was quite young, and her mother's spinster sister, Aunt Vina, had cared for her until she was fifteen years of age, then she went to the city to attend school, living at her uncle's, Myron Morse, a man not rich in this world's goods. His three daughters, as soon as their education was completed, became wage earners. Lepha was a teacher, Lauretta a saleslady in one of the leading stores, and Susie was a milliner. The girls found it quite a treat to spend their vacations at Sylvia's in the country, where berries and cream were plentiful, and vegetables fresh from the garden, with a sweet baby for a plaything, and Ivan to joke with, Sylvia herself casting the only shadow on their good times.

Aunt Vina, as she prepared for her journey, soliloquized thus: "There is a skeleton in the closet, and it will be the death of my Sylvia. I'll root it out if possible. I promised Sylvia's dying mother that I would protect her and I will, if it costs me my own happiness. Taking shares in a silver mine has made me independent, and if money can win Sylvia back to her sunshiny self, it shall not be spared."

When Aunt Vina arrived at the country station she hired a team to take her to Mr. Everets', instead of waiting for Ivan to meet her, as the others had done. When she arrived at their home, Sylvia met her at the door, and throwing her arms about her laughed and cried together. Aunt Vina eyed her keenly, feeling positive that some secret trouble was ruining Sylvia's life. At mealtime her husband came in from the field, and smiled pleasantly as he shook Aunt Vina's hand. He was very sociable when indoors, and in every way endeavored to render her visit enjoyable.

Aunt Vina noticed the change in Sylvia's looks and demeanor as soon as her husband came in, hence concluded it was he who held the key to the skeleton closet. The second night after Aunt Vina came, feeling thristy, she descended the stairs in her stocking feet, without a light, to the pantry. While in the hall she heard muffled voices and was tempted to stop and listen, and this is what she heard:

"I say, Sil, does that long-nosed, squint-eyed old maid think of staying all summer? If she don't get out of this soon I'll blow her up with dynamite. This is the fourth of your kin that has come here this summer to visit, and last summer half of your classmates were here, and I'll tell you right here that I won't stand it any

longer. Here we are pinching and scrimping to get enough together to buy that eighty. It is to be sold at sheriff's sale next month, but with so many deadbeats to feed I can't raise the money. You have got to get rid of that ugly bit of humanity or I'll make it hot for you, do you hear?"

"Why don't you quit using them so well when they are here?" asked Sylvia. "You are so good to them they call you 'a pink of a husband,' and despise me because I dare not be civil to them for fear you will abuse me."

"Fool woman that you are!" said Ivan, "I have to use them well. How would it look if I didn't?"

Aunt Vina, hearing poor Sylvia sobbing, retraced her steps, forgetting her thirst, now that she had a peep into the closet and seen the skeleton. Aunt Vina did not appear at the breakfast table, but soon after Ivan had gone out to work she came down, and it made her heart ache to see Slyvia's red eyes and wan smile. Ivan had started for the field, then thinking of something in the cellar that he would need, went back and entered the other way. The door into the kitchen was ajar, and now it was his turn. Aunt Vina was saying:

"Now, Sylvia dear, I am going back to the city today. I can go on the stage, as my baggage is light."

"Homesick so soon, Aunty?" asked Sylvia, in a cheerful voice that even Ivan noticed, and he felt a little cut that he had been so hard on Sylvia, for he really loved his wife and child, but the love of money was making him a brute to Sylvia.

"Yes, I am going. I heard you had grown pale and sad, and I knew there was a skeleton in the closet, and, too, I knew it would kill you in time unless something was done to annihilate it."

"Why, Aunty, what do you mean?" asked Sylvia in a trembling voice.

"This much, Sylvia, I knew you had some secret trouble weighing you down," said Aunt Vina, "and if that trouble was let remain it would be only a question of time ere you were laid in your grave, the same as your mother was. She was a sensitive thing like you, and her husband's secret meanness killed her before the accident killed him. She told me all on her deathbed. Now, as I promised her that I would shield you, I will do all in my power to remove the cause, or remove you. Last night I accidentally overheard your conversation."

"Oh, Aunty!" and Sylvia's voice was a sob.

Ivan's heart gave a jump, and continued to thump so loudly he could scarcely hear what was said next.

"I'm a ruined man, now," he thought. "I can never look the Morses, or any of her city friends in the eye again." He valued the good opinion of his neighbors and city acquaintances, and none but his sensitive wife knew how mean he could be.

"Come, go home with me, and leave that hypocrite," said Aunt Vina. "I have sufficient for us all. Why remain here, my poor child, and be gradually killed by that 'pink of a husband,' for die you will, or go to the insane asylum?"

"Oh, Aunty, I cannot leave little Elmer," wailed Sylvia.

"Take him with you," said Aunt Vina.

"Ivan would not let me," said Sylvia.

"You need not ask him." Then Aunt Vina said something in a lower tone, that Ivan could not hear.

"No, no, Aunty, but I thank you all the same," said Sylvia. "I love Ivan, and though he slay me, I cannot leave him. It is his way; he cannot help it."

Ivan waited to hear no more; fearing he would be detected, he did not stop to look for the oil can. As he worked, his mind was burdened with complex thoughts. That eighty he much wished for, yet what if he gained it and lost his wife. He would not care for it if Sylvia were dead. He would give up buying it, and hire someone to, at least, do the wash each week. And, too, there were many tnings that Sylvia needed in the house, but dare not ask for. Then he felt mean to think how he had talked to Sylvia about the Morses, who though poor themselves, had given her a four-years education; and Aunt Vina had been a mother to her since infancy, and to think she should hear such words from his lips. No, he could not even hope that she would forgive him. She must have means or she could not support herself, and Sylvia and Elmer, as she offered to, if Sylvia would leave him. "And she won't leave me if I slay her. Such love the angels in heaven might wonder at. Ah, Sylvia, hereafter I shall endeavor to be worthy of you, so help me God!"

Before the dinner hour arrived he called at the widow Blin's cottage and asked if she could come and do the wash for them each week, as Sylvia was not looking strong.

"I shall be glad of the work," said Mrs. Blin, "and indeed, I do think you ought to be careful of Sylvia if you want to keep her."

The widow's words rang in his ears as he returned homeward. He found dinner waiting, Aunt Vina gone, his wife tidily dressed, and baby cooing in the crib. He felt thankful Sylvia did not know of his eavesdropping, and he intended that she never should, but he would be a better man.

It was autumn. The coveted eighty had been sold, but as yet no one knew who the buyer was. It had been bid in by a lawyer from the city, for someone else. It had gone much higher than he had anticipated, and cash was paid down for it. Though Ivan had lost the eighty, he had won the respect as well as the love of his wife, for he had kept the resolutions he had made after eavesdropping in the cellar.

One day Sylvia said to him, with a happy smile: "Come, Ivan, let us look at our new possessions. That eighty the lawyer purchased for me at Aunt Vina's bidding. The house is all furnished, and I have got a little in the bank in my name to purchase stock, a carriage, and what else I may choose. Aunts come handy sometimes."

"Where is your aunt?" he ventured to inquire.

"She has purchased a home for herself in California," said Sylvia. "She is very wealthy, and has an interest in a silver mine. She will never miss the amount she has given us, she writes."

Ivan bent his tall form and kissed his wife. Tears were in his eyes; he would not trust his voice to speak, and, in fact, silence at the time was golden.

Never again did Sylvia hear aught that was mean regarding her relatives and friends from his lips, and instead of reproaching her for inviting them, he urges her to do so.

Aunt Vina had also helped the Morses, so the girls no longer work as hard as heretofore, yet their summer vacation in the country is highly prized. They noticed the change in

Sylvia; instead of a pale, sad woman, she is now bright and happy. "Money works wonders," is their conclusions, as they never knew the facts, but credit much to her "pink of a husband."—Practical Farmer.

FISH RECIPES.

The dishes given below are all substantial and nutritious, making good substitutes for meat.

Fish and Macaroni.

Break pipe macaroni into short lengths, boil it in salted water for about twenty minutes or until tender. Drain and mix with an equal quantity of flaked fish—any kind of boiled white fish can be used. Place in a saucepan two tablespoonfuls of butter, pepper and salt, and a little lemon juice; then add the beaten yolks of two eggs. When quite smooth, stir in one cupful of rich cream or drawn butter and stir until heated thoroughly. Place the macaroni and fish in this. When heated, pour into a baking dish, keeping it heaped high in the center; cover it with bread-crumbs and brown in the oven.

Codfish with Cheese.

Soak over night in cold water a piece of codfish. In the morning pick to pieces, freeing it from skin and bones. Bring a teacupful of milk to the boiling point, thicken with two generous tablespoonfuls of cornstarch rubbed into a tablespoonful of butter. When the sauce is thick, add the codfish and allow it to become thoroughly heated, but not to boil. Pour into a greased baking-dish, cover the top thickly with grated cheese and brown in the oven. Serve hot.

German Fish Pie.

Peel, wash and slice two pounds of potatoes; soak four or five herrings in warm water and break up into flakes; arrange the sliced potatoes and herrings in a baking-dish, sprinkle with salt, pepper, and add a little melted butter or cream. Cover with a paste made after any good pastry receipt. Bake the pie for two hours and serve hot with pickles.

Smothered Fish.

Take a good-sized fresh fish and, after washing and scraping, place in a double boiler and cover with half a cupful of butter and a cupful of very rich cream; season with salt and pepper. Place the cover of the boiler on and boil for three-quarters of an hour without removing the lid. This is delicious.

Curried Fish.

Remove the skin and bones from one pound of fish. Place a tablespoonful of butter in a frying-pan and add an onion chopped fine; fry until brown, then add the fish flaked. Cook for a few minutes, stirring constantly. Serve this in a border of rice that has been cooked until tender, seasoned with butter, salt and one-fourth teaspoonful of curry powder.—Country Gentleman.

TOMATOES.

With Macaroni.

Cook half a package of macaroni in boiling salted water until tender. While this is cooking, stew a quart of tomatoes with two level tablespoonfuls of butter, a tablespoonful of vinegar and a dash of cayenne. Strain the tomato through a coarse sieve. When the macaroni is done, place a layer in the bottom of a buttered baking dish, add salt and pepper to taste, then a layer of tomato, again the macaroni, and finish with a layer of tomatoes. Sprinkle with buttered crumbs and a little grated cheese, and brown in the oven.

Scald, peel and cook four large, ripe tomatoes, season with salt and pepper, and add a tablespoonful of butter. Pour one quart of boiling milk slowly over half a cupful each of boiled rice and rolled cracker crumbs. Mix until smooth. Dissolve a fourth teaspoonful of baking soda in a little cold milk, and add it to the cooked tomatoes. Just before serving stir in the hot, thickened milk. This makes a most delicious soup. The flavor may be varied by adding a tablespoonful of minced onion and enough celery salt to suit the taste.

Fried.

Cut six large tomatoes in thick slices. Dip in beaten egg and bread crumbs and fry with three very thinly-sliced onions in two tablespoonfuls of butter.

Baked.

Tomatoes are at their best when stuffed and baked, and the variety of stuffings which may be delightfully combined with them is legion. Minced onions, stewed corn, bread stuffing made as for poultry, chopped meats, oysters, fish, rice, macaroni, squash, beans and others too numerous to mention may be used in this way.

Scalloped Fish.

One of the simplest ways of using any fine fish for a second appearance is in the form of scalloped fish. Canned salmon or lake trout may be used in the same way. Remove all bones and skin, leaving the fish in neat flakes. Make a white sauce in the usual way, using equal proportions of milk and water. Season highly with salt and white pepper. When perfectly smooth, moisten the fish with it, and arrange in a baking dish, first buttered and sprinkled with fine bread crumbs. Crumbs may be used in alternate layers, if a large dish is required. Cover with the crumbs, dot with butter, and brown quickly in a hot oven.

CLEANING LACES.

White waists badly stained with p rspiration can be cleaned by putting them in a strong solution of castile or any pure soap, then placing in the direct sunlight until the yellow is withdrawn. To make the solution, shave one bar of soap and dissolve this in one to three quarts of hot water. The dirt is removed from the lace not by rubbing, but by swashing up and down in a new soap solution, and it is then thoroughly rinsed in two or three clear, warm waters. The lace is next stiffened in weak gum arabic water—one or two kernels to one pint of water. The gum arabic is added to warm water and placed over hot water until dissolved. It is well never to wring lace, but rather to squeeze the water from it. To dry the lace it is pinned on a woolen blanket or pad which has been securely fastened to a table. Each point is firmly pinned, and the lace is left until perfectly dry. Much may be done toward giving the effect of new lace if each point is not only carefully pinned out, but, when dry, picked out with the fingers.

Silk laces are cleaned by brushing or rolling in corn meal or magnesia. The dirt adheres to the flour or powder, leaving the lace clean. When treated in this way, laces need more frequent cleaning, but appear more like new lace. Yellowed, white silk lace may be steeped in a hot bath of milk and borax and bleached in the sun.—Maude A. Propst, Colorado Agricultural College.

Mayer WORK SHOES
BUILT ON HONOR
Mayer Work Shoes are made to meet the demand of all classes of working men. They are made solid and are absolutely dependable under all conditions. They fit good and look good and will outwear other work shoes at the same price because they are made of specially selected tough, seasoned stock, choice uppers, heavy soles, solid counters, double leather toes and double rows of stitching.
The Genuine have the Mayer Trade Mark stamped on the sole. If your dealer will not supply you, write to us.
We also make Honorbilt Shoes for Men, Leading Lady Shoes, Martha Washington Comfort Shoes, Yerma Cushion Shoes and Special Merit School Shoes.

AN APPEAL

TO YOUNG MEN AND WOMEN

Hurrah! California gets the Panama-Pacific Exposition!

Now let's to business. Things will hum.

Millions of people are coming to California.

Great commercial development is already in progress.

The unlimited possibilities and boundless opportunities of the great West will be seen and appreciated as never before.

All California will be prosperous, and splendid opportunities will be open to young men and women who are trained to hold responsible positions.

Get a business education and prepare for success. Get your share of the prosperity that is coming, by training yourself for something worth while. You cannot begin too soon to plan for your part of this onward progress.

The Polytechnic Business College is reaching out for a larger enrollment. It cannot now supply the demand for graduates of its complete business and shorthand courses, and this demand is constantly increasing.

We are now organizing for our Spring and Summer term. During the months of March and April we want one hundred young men and women to enroll and prepare for business positions. We shall require fully this number to supply the increased demand within a few months.

The Polytechnic Business College is helping thousands of young people on the road to success, and invites you to join its forces and take advantage of its opportunities.

May we send you our catalogue? Write today to POLYTECHNIC BUSINESS COLLEGE, 306 Twelfth St., Oakland. When writing please mention The Cultivator, and get a dozen ornamental visiting cards with your name.

Syracuse Easy Vacuum Washers and Hand and Power Vacuum Cleaners. Patented Clothes Line
Sold for cash or easy payments. 30 days Free Trial Freight paid. 6000 sold in California.

Hay.

Scott, Magner and Miller say:

Arrivals of hay for the past week were 3,970 tons, quite an increase over those of last week, which were 2,825 tons.

A good part of these receipts came in by water, and were of the poorer varieties and moved off slowly. The majority of that which arrived by rail was of a very good quality, and there has been little difficulty in placing the rail shipments; in fact, we even note a little firmness in the market on rail shipments of good quality. This, no doubt, is caused by the phenomenal advance in barley and oats during the past week, and we would not be surprised if hay did a little better shortly.

We note that several lots of hay have changed hands in the country during the week at advanced prices. At the same time we also note a great tendency among the farmers to dispose of their holdings, some of which have been carried for two years, before the new crop is available.

Export demand has been a trifle better, and we note shipment of one cargo of 500 tons to Mexico. Alfalfa and straw remain as heretofore.

We quote the wholesale prices in round lots on today's market, as follows:

Fancy wheat	13.00@13.50
No. 1 wheat or wh and oat	10.00@11.00
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.00@11.00
Other tame oat	7.50@9.50
Wild oat	7.00@9.00
Stock hay	5.00@6.50
Alfalfa, ton	9.00@10.50
Straw	40@50

Grain.

Barley, fancy	1.46¼@1.47½
Barley, good to choice	1.42½@1.45
Barley, poor to fair	1.40@1.40¾
Oats, white	1.50@1.60
Rye, new crop	1.40@1.42½
Alfalfa seed	18@20

Cocoanut cake, ton	25.00@26.00
Mixed feed, ton	25.00@27.00
Shorts	25.00@26.00

Citrus Fruit Market

LOS ANGELES, April 5, 1911.

With shipments of oranges 1,500 or more cars every week, the market has been watched with some concern, and no little satisfaction is manifested because of its excellent condition. Every offering of sound fruit is being quickly taken and at satisfactory prices. Extra choice are now commanding from $2.35 to $2.50 in most of the eastern markets. The large percentage of decay is still embarrassing, but iced fruit that has been given greatest care in picking and packing is arriving in fair condition. Because of the showers which have prevailed in some of the foothill sections the shipments this week will be somewhat under those of last week.

The situation with Mediterranean lemons is such that Californias are in still greater demand, and every offering is quickly picked up at advanced prices.

Shipments.

Shipments of oranges to date since November 1, 1910, 18,315 cars; lemons, 2,124; total, 20,439. To same date last season: Oranges, 11,743 cars; lemons, 1,786; total, 13,529.

...and a member of the ... fraternity.

SQUIRRELS THRIVE ON POISON.

PLEASANTON, February 24.—That the recent crusade against the squirrels was ineffectual is the statement made by the farmers of Liveromre valley, who declare that the rodents are more numerous than ever. It is feared that there will be a great loss of grain owing to the inroads of the pests, and several meetings are being planned for the purpose of discussing ways and means to rid the district of the destructive squirrels. It is claimed that much of the poison distributed by the Government had no effect on the rodents, and that not sufficient was given out by the agents of the health authorities.

The Treatment of Citrus Gum Disease

An Address by A. F. Call, Corona, at the Pomona Citrus Convention.

It is with a great deal of diffidence that I speak on any subject of horticulture or the care of trees, because I know that conditions are so different in the different localities, and the treatment required for different groves and different locations and at different ages is so diverse that it requires a man of very long experience and larger ability than mine to give any general advice. But this matter of gum disease is one that interested me very particularly, as I had about 1,600 trees affected four years ago, and so I gave it some study by going to Florida and into the different portions of California to make a study of it, and spent about a year in experimenting.

In my investigations of the gum disease I found at least two distinct troubles, and I want to make it clear as to which I am speaking of. I found a disease of the lemon tree and which affected some orange trees, the characteristics of which were a gathering of the sap under the bark, making blisters and pockets of sap, which, by evaporation, I suppose, was afterwards reduced to gum and broke its way through the bark and flowed down the tree, usually at a distance of about four inches to a foot above the ground. I also found that another form of the gum was the breaking out in small globules or bits of gum, from orange trees in particular, affecting the trunk and the limbs of the tree, causing a roughening of the bark and a rolling up of the bark, that is commonly called scaly bark of the orange tree.

I want to speak first of the lemon gum, as we will call it, although it does affect orange trees as well, because I am more familiar with that and the trouble is more obvious and the difficulty is more easily overcome. I found that this gum was most prevalent where the drainage was imperfect and where sediment had been permitted to pile up around the trees, such as a little depression in the orchard that had not been filled before the tree was set, so that after irrigation, in forming the grade that the water naturally forms, the earth had been piled around the trees a little too high, or where the trees had been set a little too deep. Most of the trouble came from the foot of the grove, where there was a depression and somebody had let the waste water from irrigation accumulate some sediment. I tried first to demonstrate to my own satisfaction that this disease was not contagious, not bacterial, and I think I demonstrated that completely by inoculation. I took the worst gum I could find, from the rottenest trees, and opened the bark of a great many live trees, inserted the gum under the bark, tied it down, and I was unable to produce any gum in those trees. I then endeavored to produce the gum, and I found I could produce it in a very short time in a great many different ways. I found that I could produce it by putting some strong manure or fertilizer around the trunk of the tree; or I could do it by putting on an excessive amount of water; and I could very easily do it by taking a little wooden hammer and hammering a little spot on the trunk. The gum would form in two weeks. You did not need to break the bark; just hammer it so it would deteriorate. I then concluded that gum was caused by a cultural condition, and that the cause of it was a deadening of the member, destroying its sap-carrying power, which stopped the down-flowing sap, forming pockets of clear sap; and I will say in that condition we took gum and had it analyzed by chemists, and it was pronounced simply sap and nothing else. These pockets of sap, unable to pursue their way down the tree, were compelled to remain there until the water evaporated and left this gum, and that stayed there until it rotted its way out. If that is permitted to continue, of course it will go around the tree and girdle the tree and kill it. In experimenting with the remedies, I found that these trees could be very easily cured; and I want to say here, I don't want to take credit to myself for this, wholly, because a great many of us were working together. My foreman and Mr. Jamison and Mr. Hampton and Mr. Griffin and different ones have contributed in large measure to this, so I should say "we" found this out. We found that what we needed to do was to let out that sap or gum as soon as we could, and the way we did it was by making little furrows down the tree, not too many and not running together, perhaps not nearer than an inch and a half apart, maybe two inches apart on a tree largely affected. It is important to go as high as the limbs, so a gum will exude before it forms a pocket or becomes destructive to the tree. Then we found that by oiling the bark we could hasten its recovery, and we wanted to use an oil that was softening. The worst thing to use is crude oil or crude oil and carbolic acid together; that destroys the bark. What we want to use is a soft animal oil, lard or neat's-foot oil, and we all found that neat's-foot oil was the best, so we applied that liberally, two or three applications two weeks apart. And then, to protect the bark from baking, we whitewashed the trunk of the tree, because we frequently were compelled to let the sun in. The proposition is this, that you have got to have enough bark to carry the sap, and this gum pocket usually comes from a very healthy tree, carrying much sap. The injury has come from various causes, mainly from the piling of sediment around the trunk of the tree, or by water, or by redwood stakes that have been pulled up, that the tree has grown around, or by stones that have been gathered in by the roots and absorbed by the tree. There are various ways in which this can be caused, but anything that affects the tree in that portion of the bark extending from the crown roots up above the bud. That bark was intended by nature to be exposed to the sun and air, and when it is not so exposed it deteriorates. The surface of the root is hard; it is impervious to the acids of the soil, but when you take that portion of the bark that nature intended to have exposed to the sun and air that is covered with that earth, you have nothing there that will protect the bark from the acids of the soil; it immediately gets brown and deteriorates. Then you have the condition of a big top which puts forth and uses a great amount of sap, returns a great deal of sap to the soil and a narrow channel in which to return it, because it has been partially injured by the gum; you have not enough bark left to carry the sap to the ground, and so it is

(Continued on Page 458.)

Horticultural Quarantine Work in the South

An Address by Frederick Maskew, Deputy State Commissioner Before the State Fruit Growers Convention.

Last fall I was sent to San Diego as the agent of the state commissioner of horticulture upon a special detail, and early in November I received instructions to look thoroughly into the amount of horticultural imports that were coming into the port of San Diego, also into the methods of quarantine employed in handling such material, and to report fully upon the same. As a foundation for this work I interviewed the agents and managers of the steamboat lines, the U. S. customs officers and the wharf and railroad superintendents; explaining to them the scope and functions of the horticultural quarantine law, that it was not in any way a restraint of trade but protection for the orchards of California, that it was not the plants or fruit we were striving to keep out, but the insects and diseases that accompanied the most of them. I believe that all of these parties fully understand the situation, and they have cheerfully co-operated in every way. As a result of this preliminary work, I found that there are three lines of steamers trading regularly between Mexico and San Diego; in addition to this there is a fleet of small vessels trading between Mexico and Lower California and San Diego that have no fixed itinerary; also many yachts come in at different times from foreign ports and a line of steamers from Oregon. You know anything from outside of the state of Caliornia is foreign to the work of the state horticultural commission. With this as a basis I went to work, and in all that follows, I want to say that I was very ably and cheerfully assisted by Mr. Stuart, the horticultural commissioner of San Diego county, and also by the custom house officers at that port.

There are on an average 19 vessels plying directly between Mexican ports and San Diego each month. Now let us for a moment look into the detail of this work. Take for instance one of the American Hawaiian liners. On reaching the docks they are first inspected by the immigration officers and customs officers, the latter placing a man at the gangway to see that no one leaves the vessel without a permit. It is then the turn of the horticultural officers, and there being no passengers or baggage, the first thing is to get the manifest and see what composes the cargo. If there are any horticultural imports in the cargo, it is a simple matter to get control of it, because having the good will of the dock officials, they will segregate and hold it until it has been inspected and properly treated. It is through the crews of these vessels that the danger of introducing insect pests is found. By experience I have found that it expedites matters a great deal to be on good terms with the purser and chief steward. Most of the fruit or plants brought by members of the crew is usually kept in the cool room, and all of this with the assistance of the purser and steward can be readily gotten at and inspected. Oranges, mangoes and guavas are contraband and are destroyed whenever found, other material is inspected and if found clean and free from pests is passed, that is a red label is attached which permits the owner to take it ashore at such times as he sees fit. We have found that even this procedure followed by an inspection of the ship is seldom complete, and that the only safe way is to watch the gangways and search every one leaving the vessels.

I will next speak of the Mexican Navigation Company's steamers. We always expect horticultural contraband in this instance, and always find that our expectations are realized. These vessels bring many Mexican steerage passengers, whose baggage consists largely of packing boxes they have secured from home stores. An inspection of these reveal a national trait, a characteristic of the people, the habit of Pelon. Packed in with articles of domestic use are to be found oranges, lemons, limes, mangoes, guavas, cactus fruit, dried fruit, sugar cane, cuttings of plants and trees, cocoanuts, seeds and many forms of dried herbs. All the laws of Christendom will never stop this practice. It is not a commercial, not a business venture, but the custom of a people; of a nation, a national characteristic, "Un pelon por mi amigo," a gift for my friend. No one has helped us more in this particular matter than the managing director of this line, who speaks the language of these people freely, and I know that he will

CITRUS Trees

Buy and Plant Citrus Trees NOW

We have a magnificent stock of the best varieties still on hand and are prepared to fill orders for almost any quantity from our extensive nurseries either at Whittier or Exeter.

ORANGES

As a revenue producer, where conditions are favorable for its development, one year after another, we know of no more profitable variety than

THE VALENCIA LATE

On account of its coming on the market in the late spring and early summer months and the further fact of its being an acid fruit, makes it sell nicely in connection with deciduous fruits.
VALENCIA LATE ORANGES have sold at higher prices than any other oranges and in favorable localities where there is no danger of the fruit getting frozen, the Valencia is sure to be a money winner on account of its increasing strong demand. It is a vigorous grower and prolific bearer. Actual returns from producing orchards show more net profit per acre than from any other orange grown. We have a fine stock of 2-year-old trees and can fill your orders for these trees as well as the WASHINGTON NAVEL in almost any quantity.

3000 Grafted Walnut trees

People who intend to plant lemon or grafted walnut trees this season will have to secure them from some source early as they are now very scarce.

A. R. RIDEOUT

Magnolia Nursery Whittier, California

agree with me when I say that our only hope of prevention is in the rigid inspection of each individual case.

In dealing with the vessels plying between Ensenada and San Diego, the material handled is practically all personal baggage, the inspection of this is very thorough and the opportunity to detect any items of horticultural interest an open one. In dealing with this class of the work, there are many actions taken that to the casual observer might appear trivial. But it is well always to remember that with perhaps the single exception of purple scale, most of our orchard troubles have gained an entrance upon some object of small commercial value.

As an illustration from which you can draw your own conclusions as to the necessity and value of the work, I will relate a single instance: On November 22nd, Mr. Stuart and myself, through the courteous assistance of a customs officer caught the chief cook of the Steamer Isthmian coming ashore with a basket of fruit called Achras sapota. This fruit looks like a persimmon with a russet skin. As usual he declared he did not intend to sell these, but was taking them as a gift to one of his friends. We went over these carefully for any evidences of scale or insect pest and finding none, cut one open. There was a maggot at work busily consuming the fruit immediately around the pit. Several specimens were found free of maggots, but one had eight or ten. These I confined in a breeding jar and destroyed the remainder of the fruit. From that material I bred, and have, the adult flies, typical fruit flies. They are not the adult of the orange maggot, Tyrpeta ludens, but very closely akin.

The horticultural imports at San Diego are increasing daily, and there is, I understand, another line of steamers to be put on about the first of April, with a view to working up trade in fruit with Mexico. In my opinion, based upon the experience of four months, the volume of work at the present time is sufficient to warrant the regular employment of a horticultural officer. There are occasions or periods in which he will have some time to pursue other work along co-ordinate lines, but he should be so situated as to make the quarantine work the paramount issue. A quarantine officer must be prepared to be on the dock at 6:30 a. m., 365 days in the year. Modern transportation recognizes no Sundays or holidays, once a vessel is released from the health quarantine and comes up the bay it is the lookout of the horticultural inspector to be on hand when she makes the dock. A quarantine is not perfect if one item gets through in five years.

There is just one other matter to which I wish to call your attention. I want to say to the fruit growers of California that they are under deep obligation to the U. S. customs officers of the California coast line. Cheerfully, willingly, in and out of season, without, in this particular work, any remuneration or even recognition, they always co-operate in the work of horticultural quarantine. In the aggregate they have rendered services of great value to, and are among the best friends of the fruit industry of California.

Residents of Baldwin Park, Los Angeles county, are making vigorous objection to the establishing of a hog feeding plant to be supplied with food from the garbage wagons of Los Angeles.

THE MUTUAL INFLUENCE OF STOCK AND SCION.

By Dr. J. Eliot Coit, of the State Pathological Laboratory, Whittier.

Recent discussion of the influence of stock on scion in the columns of the Cultivator seems to indicate sufficient general interest in the subject to warrant a brief review of the literature and a summing up of known facts in regard to the subject.

The amount of the influence between stock and scion varies greatly and it is usually necessary to determine by experiment just what this influence will be for any given combination of stock and scion. The stock may dwarf the scion and upon this fact is based the practice of producing dwarf fruit trees by grafting the pear on the quince and the apple on the Paradise stock. Such dwarfing in many cases increases proportionate fruitfulness. Some stocks cause the fruit of the scion to ripen earlier than would otherwise be the case. The stock may change the condition of the scion from vegetative growth to fruitfulness. A twig from a seedling apple which ordinarily might not fruit for many years, may be made to fruit at once by grafting it in the top of an old bearing tree. In like manner many oranges will come into bearing sooner when worked on Citrus trifoliata stocks. Some stocks may increase the size of the fruit as in the case of some varieties of the pear worked on the quince. Stocks may also influence the flavor of fruit, for apples often derive a bitter flavor when worked on wild crab roots. On the other hand, the quality of the flavor of the fruit may not be affected, for sweet oranges worked on Citrus trifoliata and C. bigaradia do not partake of the bitterness of the stocks.

Variegated stocks may in some cases, such as Passiflora, Jasiminum and Abutilon, cause variegation in the scion and vice versa, but this is thought to be due to a virus which is able to pass through the point of union. In the case of the red-leaved hazel grafted on the copper-beech it was found that leaves arising from the stock also contained some red cell sap. Variegation in the orange has been found to act similarly (see letter of Lyman Phelps in the Cultivator for March 30, 1911.)

On the other hand, many evergreen species may be grafted upon deciduous stocks without appreciably influencing their evergreen character. Such cases are Prunus laurocerosus on Prunus padus, Quercus ilex on Quercus sessiliflora, Cedar of Lebanon on European Larch, loquat on quince, and sweet oranges on Citrus trifoliata.

All of the influences above mentioned are due more to variations in nutrition than to any other factor. It is well known that the roots of different species of plants draw upon the soil for mineral foods in different proportions and it is difficult to conceive of how sap of different chemical composition could fail to influence the scion, although much of such influence may result in physiological changes which may not be manifested by any outward sign.

The union of stock and scion is perhaps more of a mechanical process than a biological one. The cells constituting the contiguous surfaces of stock and scion do not unite by fusing their contents after the manner of the reproductive cells in the blossoms. The mechanical union is brought about by the formation of callus cells (similar to those formed at the base of a cutting or around wounds) which dovetail together, thus filling up the interstices. From such nascent interlocking cells the conductive vessels are formed. Every cell at the point of union maintains its individuality, being in every case either a stock cell or a scion cell with no mixing whatever.

The question has recently been raised as to whether a section of lemon wood being interposed as a part of the trunk between the root and bearing top of an orange tree, could exert a deleterious influence on the flavor of the orange. If such an influence should exist it must come about by some change in the condition of composition of the orange sap as it passes through the lemon wood. Now we know that the crude sap from the roots passes up through comparatively large ducts in the outer wood to the leaves where it is completely worked over and prepared for use in the growing fruit. The lemon wood in this case acts merely as a conductor of liquids from orange roots to orange leaves and it is almost inconceivable that the chemical composition of the sap should be altered in its passage through the comparatively large tubular vessels in the lemon wood. There is, however, a great deal of actual evidence in the older orchards which bears out this conclusion.

For a time after the graft is made the sap must pass through ducts which may be somewhat sinuous in their passage through the calloused union. This results in a restriction of the food supply which varies with the different plants and which often results in dwarf and percocious plants. As time progresses, however, new layers of sap-wood and heart-wood are laid down, the tissues originally involved in the graft are grown over and become heart-wood and new, continuous conducting vessels are formed. It should be remembered that the thin layer under the bark known as the cambium is the only part of a tree which is alive, the outer bark and heart-wood being quite dead and unable to unite with anything. Both the old stock and scion are enveloped by continuous layers of new cambium laid down each year, the line of demarcation between stock cells and scion cells being usually at right angles to the axis of the shoot.

It often happens that stock and scion do not increase in diameter at the same rate, resulting in a constriction at the point of union. This does not necessarily mean that such unions are weak. In fact, it has been shown by various tests that graft unions between plants, which take readily, may be and usually are the strongest points and are rarely subject to breakage.

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Our finely illustrated booklet, "Citrus Fruits," covering the industry from the seed to the market, mailed to any address on receipt of 25c in stamps.

Deciduous Bush-Tree Fruits

LEAF CURLING OR PURPLE APHIS.

From Bulletin of County Entomologist W. H. Volck, Watsonville.

The leaf-curling aphis is usually the first plant louse to appear in the spring. It attacks all varieties of apples, and can be recognized by the pronounced effect on the shoot that it infests. The leaves curl in towards the under surface where the colonies of aphis are located. This curled foliage has a sickly, yellow green color and a more or less rumpled surface. The distortion and twisting is also apparent in the shoot which bears the leaves.

When a fruit spur is attacked the apples also suffer seriously, and in most cases are rendered worthless. The poison injected by the aphids causes an abnormal number of fruits to set, but the "aphis apples" do not grow normally. They often get no larger than a walnut, are much deformed and do not develop the normal flavor or character of pulp.

The reactions produced by the aphis are undoubtedly due to the injection of a toxic substance in much the same manner as a mosquito injects poison at the same time that it is sucking blood from an animal. The poison injected by the aphis travels along the shoot and starts leaves to curling which have not yet become infested. This provision of nature works to the advantage of the aphis as a shelter is provided for the insect in advance of its coming.

Life History.

The full life history of this insect is still in doubt. In the spring it is in the unisexual form. All the individuals are females and bear living young (do not lay eggs). Some of these females develop wings and so are able to fly to other branches or trees and start new colonies.

This process does not continue through the season for in the month of June all the individuals suddenly develop wings and fly from the trees. They do not establish new colonies, but appear to wander aimlessly about and the great majority of them die. What becomes of the few that are necessary to perpetuate the species is not definitely known. It is supposed that they migrate to some other food plant.

An eastern entomologist states that a few sexual females return to the apple trees in the fall and lay a small number of eggs.

The leaf curling aphis, like other plant lice, sucks the sap and does not eat the surface of the leaves. It also produces a considerable amount of honey dew, but the black smut fungus does not appear to thrive on it so the trees seldom become black as a result of the work of this species.

Extent of the Damage.

Often this aphis attacks only a few twigs on a tree in a single season. Under such conditions the damage is trifling and can be overlooked. Under other conditions the infestation may be general, resulting in a great loss to the apple grower. This aphis is capable of destroying the entire crop and has done so in several local orchards for the past three years.

The behavior of this pest cannot be predicted in advance. Much if not all depends on the nature of the early spring season, an we have not yet determin-d just what the factors are which favor the increase of this plant louse.

Remedies.

Owing to the fact that the leaf curling aphis colonies are almost always protected under the curled up foliage effective spraying is very difficult. The only method that has proved successful is to begin early, while the trees are yet in bloom. At this time the aphis is just starting to increase, and not many leaves will be curled up tight, so that thorough spraying of the under surface of the foliage will reach most of the insects.

In addition to this spraying a very careful watch must be kept and the application repeated whenever there is any sign of increase. In some cases it may require three or four sprayings to prevent undue injury.

Formula.

One pound "Black Leaf 40" (nicotine sulphate containing 40 per cent nicotine) about 1-10 gallon; 10 pounds whale oil soap; or 1 gallon cresol soap; 200 gallons water.

When whale-oil soap is used it must be melted in boiling water. Add the melted soap to the water in the spray tank and start the agitator, then add the "Black Leaf 40" and continue agitation until thoroughly mixed.

Cresol soap is a liquid and requires no heating. Add it directly to the water in the spray tank, agitate and add the "Black Leaf 40" as before. In our experiments the cresol soap has proved superior to whale oil as the cresol forms a compound with nicotine which appears to be more poisonous than the free nicotine.

Soap of any kind improves nicotine sprays because the penetrating and wetting power is increased by the addition.

Smaller quantities of this spray can be made by using proportional weights of the materials, thus ¼ pound of "Black Leaf 40" and 1 quart of cresol soap makes 50 gallons of spray.

Method of Application.

The trees must be thoroughly drenched with this spray to do good work. It will require at least double the amount commonly applied for the codling moth. The nicotine spray kills by contact with the bodies of the aphids and the insects will escape unless they are thoroughly soaked.

Combined Sprays and Precautions.

Nicotine sprays, when used alone, have caused no injury to the foliage or fruit, but when combined with the Bordeaux mixture serious injury has resulted, due to the liberation of soluble copper. For this reason nicotine should not be combined with the Bordeaux mixture. These sprays should be applied separately, and if close together, the nicotine should be put on first.

If it is desired to use a fungicide along with a nicotine spray it had best be iron sulphide, usual strength, arsenate of lead may also be added. With these combinations, however, the soap recommended with the straight nicotine had best be omitted.

The Lime-Sulphur Solution as a Preventive.

As a result of the accidental observation of the effect of strong lime-sulphur solution, Mr. G. F. Gallagher of Agnew, Cal., found that apple trees which received the application were

Likfresh Your Fruits and Vegetables

To the Readers of the California Cultivator:--

THE CALIFORNIA LIKFRESH CO. earnestly invites you to visit its demonstrating plant and bring products from your orchard or garden to be Likfreshed free of charge.

The process is termed LIKFRESHING because the products treated contain in their cell structure the essential oils, acids, sugar, and other constituent elements unimpaired and require only water to restore them to their **original appearance, color** and **flavor** when cooked.

FRUIT GROWERS OF CALIFORNIA: With a Likfreshing plant on your place or in your vicinity, you can furnish the markets of the world throughout the year with peaches to be eaten with cream, strawberries for short cake, and other fresh fruits without refrigeration or cold storage.

VEGETABLE GROWERS: Think of being able to market all over the world throughout the year, corn on the cob, string beans, peas, cauliflower, asparagus, etc., with freight charges greatly reduced and with canning expense and danger of ptomaine poisoning entirely eliminated.

A LIKFRESHING PLANT IN YOUR COMMUNITY means the conversion of your perishables into staples that may be marketed anywhere and at any time. It brings the market of the world to your door no matter how remote your section may be.

THE ESSENTIAL PARTS OF A LIKFRESHING PLANT: (1) The drying chambers so constructed as to eliminate the vertical heat rays and so to distribute the lateral rays as to greatly hasten the evaporating process. (2) The Furnace so constructed that it will give all the heat required with only one-sixth the fuel necessary for an ordinary evaporating plant with heat and air supply under perfect control from the floor on which drying is done.

Plants are built in units to hold 200 (thirty-pound capacity) trays and averaging one ton of dried product in 24 hours. Cost of plant is nominal and cost of operating is less than evaporating or even sun-drying.

THE ADVANTAGES OF OUR PROCESS.—It requires less time and less expense. Requires little sulphur for bleaching. Gives more dried product per ton of green product. Superior quality of product in every respect.

It will be necessary for you to come at once and file your order if your community is to have a plant for this season.

If we fail to substantiate any claim made in this announcement, we will pay the expense of your trip.

Largest Poultry Farm in U. S., Angola, N. Y., covered with J-M ASBESTOS ROOFING

HOW ANY FARMER CAN SAVE HUNDREDS OF DOLLARS

As you know, from experience, it doesn't take long for a leaky roof to spoil a good many bushels of corn, mildew a lot of hay, or damage expensive machinery by rust.

Stock is harder to keep—more feed required—in damp quarters under a leaky roof than when always snug and dry.

Sparks and embers from a nearby fire are very liable to set fire to buildings covered with an inflammable roofing.

And nearly all roofings have to be painted every two or three years.

Thus, a roofing made of perishable, inflammable materials is apt to cause you to lose hundreds, perhaps thousands, of dollars—is *sure* to cause you much unnecessary trouble and expense you could save by covering your buildings with J-M Asbestos Roofing—the practically everlasting *stone* roofing. This roofing is permanently leak-proof. It never needs a single cent's worth of paint. And even if surrounding buildings burn to the ground, it can't affect this roofing, for a flame intense enough to melt iron will not burn it.

J-M Asbestos Roofing

Won't Burn—Won't Rot nor Rust—Needs no Painting

There are hundreds of buildings today on which J-M Asbestos Roofing has withstood the storms of fifteen to twenty-five years—withstood the beating rains and scorching sun of summer, and the snow, winds, freezing and thawing of winter.

The reason J-M Asbestos Roofing is practically indestructible is because it is literally made of *stone*. Its base consists of several layers of pure Asbestos Felt. And Asbestos, you know, is a fire-proof, rust-proof, rot-proof *rock* or *stone*.

We cement these layers of stone felt together with Trinidad Lake Asphalt—the mineral cement which in street pavements stands the grinding of wheels and the pounding of hoofs for thirty to forty years.

J-M Asbestos Roofing is sold by most dealers. If not at your dealer's, our nearest Branch will supply you direct—also apply it, if desired.

Give us your address and we'll send you a book which clearly explains the big difference between J-M Asbestos Roofing and other roofings. We'll also include a sample of the curious Asbestos Rock from which this roofing is made.

Write now for sample of crude Asbestos and our Book No. K 55

practically immune to the aphis while adjoining, unsprayed trees were very badly attacked. Mr. Gallagher first observed this difference two years ago. Last year he did some spraying with special regard for the aphis and the results were similar. The observations of Mr. Gallagher are confirmed by Mr. Earl L. Morris, horticultural commissioner for Santa Clara county.

The lime-sulphur solution was about one-half stronger than that usually used for the San Jose scale, and the application was made after the buds had begun to swell. It is probable that ordinary strengths of lime-sulphur would have the same effect, but in lesser degree. A notable fact, in this connection, is that the orchards in the Pajaro valley which have suffered most from the leaf curling aphis are those that have not been winter sprayed.

In our sprayed orchards, however, there has always been some damage from the aphis. Aphis was also reported on the trees sprayed by Mr. Gallagher but the pest did not increase enough to do any damage.

This apparent control is probably not due to the killing of winter eggs, as the aphis on near by trees could quickly reinfest those sprayed. The effect is apparently due to the establishment of a sort of immunity in the tree, a curious result when it is remembered that sulphur applied during the spring and summer increases the tendency to become infested with aphids.

To duplicate Mr. Gallagher's work the commercial solution should be applied 1 to 6, and the home-made formula should contain 90 pounds of sulphur and 45 pounds of lime to 200 gallons. The spray is applied when the buds are swelling or the latter part of March. After the opening of the buds and at the time the first blossoms are appearing the concentration must be reduced to ordinary winter strength or less. It is probable that ordinary winter spraying done at this time should give reasonably good results as an aphis preventive.

WHAT COLORS THE APPLE?

The question was recently asked me, What is it in the soil that gives color to apples? It is not what is in the soil, but what is overhead, that affects the color. But I want right here to give another proof that anybody can understand and can make use of at the right time in the year. Let us suppose that it is picking time for winter apples. Let us go into an apple orchard, no matter where, and pick out a loaded tree, no matter what variety. Let us choose a Winesap. If the tree is large, there may be thirty boxes of apples on it. Are they all the same color? Anyone can answer that question, unless he has lived all his life in a city and is as ignorant of common things as the litle girl who lives in Seattle, who told me herself that she was ten years old before she knew where milk was procured—she thought it grew in tin cans!

Some of these apples will be red all over, some few will be red on one side, and some will be quite pale in color. Now, where do you find the solid red apples? On the outside of the tree. Where do we find the half red and the pale apples? On the inside of the tree top, where the apples are more or less shaded. It cannot be the soil that causes these various colors, for they are all on the same tree and derive their nourishment from the same soil. What do the apples on the outside of this top get, that the other apples do not get? Nothing but sunshine. Then what gives that solid red color to part of the apples on this tree? Nothing but sunshine. Then what is it that gives a better color to some apples? Nothing but sunshine. Where do we have the most sunshine? Where the skies for most part of the time are cloudless.—The Ranch.

WINTER INJURY TO FRUIT TREES BY SUN SCALD.

There is always more or less injury done to fruit trees by sun scald during the winter. It must be remembered, however, that every little blister or roughened bit of bark found on the tree is not due to sun scald, as is so often attributed. Sun scald for the most part is found on the southwest side of the tree, and seldom runs up into the scaffold limbs.

Sun scald is more easily detected in the spring than during the winter, as at that time the outside bark turns to a brownish black color, and this discoloration extends through to the sap wood.

At this time of year it is well to make a careful survey of the orchard, and if any discoloration is to be found, it would be well to prevent any further injury by either applying a good coat of whitewash or wrapping with some light-colored building paper, or, where rabbits are likely to do damage, it would be well to use wood veneering, or common fly wire netting. A very good formula for a whitewash is as follows:

Quicklime	30 lbs.
Tallow	4 lbs.
Salt	5 lbs.

Water—enough to make mixture flow well.

It is well to have the tallow melted and the salt dissolved before placing in the stone lime while it is slacking. This mixture makes a tenacious whitewash and one that is not easily washed off by rains or removed by other means. If wire netting is to be used, the strips should be cut wide enough to extend around the tree and to have about half an inch to turn back. This will help to hold the netting in place, as it can be overlapped and hooked into the opposite side. The height of the netting depends upon the distance the scaffold limbs are from the ground. As a rule, eighteen to twenty-four inches is sufficient height for the netting.—R. S. Herrick, Colorado Agricultural College.

TOLL OF THE TALL TIMBER.

The Agricultural College of the state of Washington, through its farm demonstration department, has been conducting tests on the logged-off lands which have attracted great attention. The system used is called the char-pit method of burning stumps. At the meeting of the Southwestern Development League at Vancouver recently, Professor H. W. Sparks, supervisor of the demonstration farm of the Washington Agricultural college, conducted some very successful tests.

Where stumps are twelve or fifteen inches through it has been found more economical to pull them out with a horse and capstan, or with a donkey-engine. Where stumps, however, are too large for removal in this manner, the char-pit method has demonstrated its ability to clear the land of stumps at small expense. The method is very simple. The bark is removed from the stumps for a height of about two feet above the ground. Dry kindling wood, bark and litter are placed entirely around the stump. Earth is shoveled to a depth of from three to six inches over the wood and bark surrounding the trunk. An opening about a foot wide is left and the fire is started by means of pitch pine. When it is well started, the opening is covered, leaving a small crevice for draft. It takes from six days to two weeks for a stump to burn out completely by this method. The fire follows the roots to the very end, and if care is taken to keep the fire always covered with earth, there is little chance for failure. —Fred Lockley, in Pacific Monthly.

STREET TREE PLANTING.

Mr. James H. Reed, tree warden of Riverside, recently made an address before the City Club of Los Angeles in which he appealed for more uniformity and more attention to roadside tree planting. Mr. Reed is an enthusiastic tree lover and in addition he figures out a good hard cash asset to any county from the planting. A part of Mr. Reed's address follows:

"We cannot mend the past but we may profit by its experience, and I insist that no time should be lost in entering intelligently and vigorously on the work of beautifying our residence streets in a general way. This means a radical change in methods. It is as absurd to depend on adjoining property owners to beautify our streets as it would be to depend on their wisdom and efficiency to build roadbeds and sidewalks.

"When a man builds a fine residence on large grounds or a small bungalow on a city lot, he at once sets about beautifying the premises. It is just as desirable that a city, as a unit, when it has built good roadways, should at once begin to beautify them. A street, however well made its roadbeds and sidewalks may be, without suitable ornamentation is as uninviting as a fine mansion set in large bare grounds, or a cottage with a bare dirt frontage.

Would Enhance Values.

"Riding with one of our conservative merchants the other day I called his attention to a row of trees along two continuous blocks and asked him for what amount of cash in hand the city could afford to have these trees dug out restoring it to the condition of three years ago. 'Not for $1000,' was the prompt reply. These trees have cost our city, including planting and care, less than $50. Since we began our systematic work in Riverside we have planted what is equivalent to more than 500 such blocks.

"I consider $10 to $20 each a very low estimated value for every suitable tree on a public street property placed and cared for when it is two years old as a purely revenue-producing asset to any residence city. After all the purely esthetic value of street beautification, to an intelligent community, is really much greater than the economic.

"I have said that the only way to have this work done satisfactorily is for the city to do it. Ordinarily this cannot be brought about directly. A public sentiment must be behind it. Intelligent individuals must start the matter through some sort of local organization to demonstrate the efficiency of systematic effort.

"We interested our chamber of commerce first. The work of its tree-planting committee soon induced the city authorities to take it up. It had developed a public sentiment that heartily sustained the new department. Improvement societies, women's clubs, tree-planting associations, will accomplish much in the way of this preliminary work. But such organizations are necessarily more or less short lived, since their efficiency usually depends on the enthusiasm of a few leading spirits, necessarily of limited duration. Hence the main purpose of such efforts should be to lead the way to municipal control.

"My last word is, I believe, that from either the commercial or esthetic standpoint, there is no feature of betterment of your city more worthy of your sincere attention than the proper, permanent and general beautification of your residence streets.

"On residence streets whose traffic is local and light the roadbed frequently occupies quite too large a proportion of the street. From the material point it is absurd to build a roadbed from 32 to 36 feet in width when 22 to 26 feet would serve better, to say nothing of the greater cost of maintenance, as well as the initial expense. From the esthetic point of view the folly is greater. We want n more of the glaring macadamized surface than traffic needs, while every foot added to properly improved parking spaces materially adds to the beauty of the streets."

SICK ACACIAS.

What is the reason that my acacias, cultriformis and Baileyana trees look yellow and seem to be sick unto death? They are planted in the lawn, which is well fed and watered to keep it in a luxuriant condition at all times?

Too much water. This family of trees are of the drouth resisting class, and when once established do well in this climate without water during our rainless summers. A good syringing once a month to keep the foliage clean and free from dust and cobwebs is all the water they require, if the soil is deep and the surface kept fine or heavily mulched.—Pacific Garden.

SEA LAVENDER.

One of the prettiest little flowers used for mixing with cut flowers is a dainty spray, one of the lavenders. More technically, it is statice latifolia, a perennial with broad and long leaves in low growing rosette from which grow strong branches completely covered with dainty pale blue flowers. It is a native of Russia, and has been given extensive cultivation in the United States. It should be given deep soil in a sunny spot and left undisturbed.

THE EARLY GARDEN.

There is not a better way to begin to plan one's garden than to do it on paper. Make a scale drawing of your premises—that is, a diagram of the shape of the lot, letting each inch represent so many linear feet, in accordance with the actual dimensions of the plot. Next, draw in the roadways, if there are any, the paths, and the walks, marking the location of shrubbery and trees. With this sketch before you, proceed to lay out the ground plan of your garden-to-be. Remember that the flower garden should have a position where plenty of sun will reach it both morning and afternoon; thus seek a southern exposure if possible. While a southeastern slope is an ideal location for a vegetable garden, vegetables will thrive in many places where flowers would not do so well. The soil will, to a great extent, dictate the garden's location with many, although the summer and fall months can be given over to developing and enriching the soil by fertilizers, where it is less rich than it may be in some less suitably located position. Do not make the mistake of planning a larger garden than you can take care of, for nothing is a more dismal sight than that of an over-ambitious garden that it has been impossible to live up to.—Gardner Teall, in Harper's Bazar.

TREATMENT OF GUM DISEASE.

(Continued from Page 451.)

necessary to cut off a part of the top. For instance, if you had a half-inch pipe and you are trying to carry a big amount of water through a two-inch pipe above and you could not carry it down and it was overflowing, you would either have to enlarge your outlet or shut off your source. You cannot enlarge your outlet all at once, so the only way to overcome that gum is to cut off part of your top. Right there is a fact which I don't know how to explain, and that is, if you cut your top off even all around it won't do any good, but you have got to cut your limb clear back to the trunk. Mr. Griffin has cured their entire grove by this method, and he will agree with me in saying that you have got to cut your limb back to the trunk. We found that absolutely important and vital, because that stops the flow of sap down through the destroyed part of the tree and gives it a chance to heal up. In a lemon tree, cut the big limb that is right over the gum spot; in a year or two it will heal over and you will never feel the loss. A lemon tree is different from an orange tree in this.

Right here I want to say that I am not a scientific observer and I have no scientific education, but I have found from observation that the sap-carrying cells of a lemon tree run right up and down. You find trouble with a lemon tree and you will find it right straight down, but in an orange tree you may find it any old place, that is, apparently. I say that with some diffidence because I don't know that to be a fact, but I say apparently so, because I find the difficulty in an orange tree on the opposite side from where the trouble appeared on top.

The next thing to do is to remove the cause, and the best way to remove the cause is to establish drainage. You cannot cure it unless you establish drainage. The next thing to do is to clear the earth away so that you can expose the crown roots so that the air can get at them, and see that the water does not settle around your tree or the sediment does not form around your tree, and if you do that, in time you will save your trees. I demonstrated to Professor Ralph Smith that you could save a tree that had only an inch of bark left. Now, there are about four inches of bark almost going around the tree, and the tree is bearing heavily. It can be done when you have got down to a very narrow proposition, and I think I can say with perfect safety that this will absolutely cure the gum disease on lemon trees, because Mr. Jamison has done the same, and Mr. Leffingwell. I have never heard of a failure where these directions were faithfully carried out. There might be a case where you could not get drainage that you could not get the results, but where you get drainage you can save your lemon trees.

Now, with regard to scaly bark on the orange tree I am not so clear, and I would not want to say with any great certainty as to the cause or the cure. I can only give you my experience. I had 400 of those trees in my grove, mostly among the older trees, and I investigated the roots of each one of them. I put a careful man at it and had him go down to the roots, and in every case but two I found what we thought was the cause. It was usually a stone buried in the tree or covered in by hard sediment that had formed around the tree from silt that had got hard, or by a redwood stake, or by a crossing of the roots that stopped the circulation, and in a few cases bad crossing of the limbs had caused it. We removed what we supposed to be the cause. Where we found a stone buried in the roots of the tree we hammered it out, or took up a stake, or took out cross limbs. We pursued the same remedy we did with the lemon trees; that is, we dug away, exposed the roots, oiled with neat's-foot oil, furrowed the front of the tree. Where we found a yellow color we cut it out, and I have lost four trees out of 400; the rest got well; the scaly bark entirely disappeared. So I feel that I can say that I have an opinion that it is local trouble with the tree, and that it is more frequent in a piece of sodden ground than in a piece of ground where the soil is loose. I have given this experience to several, and some have reported to me that their trees had recovered. I have had reports from but few on this branch of the trouble.

IGNEOUS ROCKS.

On the geologic map, rocks are distinguished as igneous, or of plutonic origin, as sedimentary, and as metamorphic, metamorphic rocks having undergone a chemical or physical metamorphism.

Igneous rocks are those that have cooled and consolidated from a state of fusion. Molten material or magma from the bowels of the earth has from time to time been forced upward in fissures or channels of various shapes and sizes through rocks of all ages to or nearly to the surface. Rocks formed by the consolidation of molten material, within these channels—that is, below the surface—are called intrusive. Where inclosed by rock, molten material cools slowly, with the result that intrusive rocks are generally of crystalline texture. Where the channels reach the surface the molten material poured out through them is called lava, and lavas often build up volcanic mountains. Igneous rocks that have solidified at the surface are called extrusive or effusive. Lavas generally cool more rapidly than intrusive rocks, and as a rule contain, especially in their superficial parts, more or less volcanic glass, produced by rapid chilling. The outer parts of lava flows also are usually porous, owing to the expansion of the gases originally present in the magma. Explosive action, due to these gases, often accompanies volcanic eruptions, causing ejections of dust, ash, lapilli, and larger fragments. These materials, when consolidated, constitute breccias, agglomerates and tuffs.

320-ACRE HOMESTEADS.

The classification or designation of lands enterable under the 320-acre or enlarged-homestead law devolves upon the United States Geological Survey. Areas are recommended by that office as being subject to entry under that law provided they are found to be not susceptible of irrigation from any readily available water supply. Since the passage of the enlarged-homestead act in February, 1909, the Survey has recommended for designation 189,127,778 acres as thus subject to homestead entry in 320-acre tracts. During February, 153,412 acres were so classified, as nonirrigable. The designations having been made by the secretary of the interior, the lands are then made subject to enlarged entry by the general land office.

Strawberries are slow in ripening and growers estimate the season will be at least a month late.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

WHAT TO DO WITH TUBERCULOUS COWS.

A recent Iowa law suit—one of those law suits that does no good to anybody and does harm to everybody concerned—has again raised the question, in a very pointed way, as to what is the best thing to do with dairy cows that have been tested with tuberculin and decided to be more or less tuberculous. One of the state institutions had a dairy herd which, on being tested, was found to be, practically half of it, tuberculous. There was a good deal of dispute in this law suit, not as to what should have been done with them, but as to whether the right thing was done or not.

There are three things that can be done with such cows. They can be kept in the herd, fed and milked as usual, the milk used in the family or sent to market for other people to use, until the whole herd is infected, which in time will die, and the carcasses be fed to the hogs. This is what is often done, and is one of the worst ways, first, because if these cows are kept long enough, having become tuberculous, they will die of tuberculosis. In the second place, if hogs are allowed to follow them, the hogs will become tuberculous; and inasmuch as you can not tell whether or not a hog is tuberculous until it is killed, the packers will figure out about the average per cent of loss in hogs and charge it up to the farmers generally who sell hogs on that market. This is one way, and a bad one.

Another way is to sell them privately to the neighbors, or hold a sale and sell them publicly to neighbors who are not acquainted with the fact that they are tuberculous, and thus start the disease in other herds, not merely herds of cattle, but of hogs, and in the flocks of chickens as well. This way is just a little worse than the first, because the man is trying to save money for himself at the expense of the community—a very, very mean thing to do, and something which only a mean man will do. By a "mean" man, we mean one who is destitute of real principle.

Another way is to separate these cows from the rest of the herd, let them raise their calves for a year or two, and then before the disease shows any outward symptoms fatten them for the market and send them to be slaughtered. This will gradually wipe out the disease in the herd, if the calves when weaned are put in with the sound herd, after being tested with tuberculin. It will not work if the calves are allowed to be in the stable with the dams.

This would be a perfectly honest way of dealing with it, if the farmers sell these cattle "subject," that is, subject to inspection in a market where there is a government inspector. For it must always be remembered that the fact that a cow is tuberculous does not always render the carcass unfit for food. If the affected parts are limited to the offal, the meat of the cow is quite as good as the meat of a healthy cow. If it has attacked the edible portions, however, what people usually eat, then, unless it is very thoroughly cooked, there is some danger of spreading the disease among human beings.

The way that was taken in the case referred to was to send the cattle in a bunch to the market, at which there was government inspection. There was not the slightest danger, therefore, of these animals doing harm to any one. A better way would have been to advise the buyer, if this was not done, that the cattle were tuberculous, and sell them "subject." The buyer, however, would naturally suspect these cattle were tuberculous. Why should dairy cows, some of them in full milk, and all or nearly all of them in milk, be sent to a slaughter house unless they were tuberculous? What should have been done was not merely to advise the buyer, but to advise the state veterinarian of the fact that they were to be slaughtered, have him personally witness the slaughter, and then report as to the percentage that were found to be tuberculous in the offal alone, and in what proportion the meat was affected. This would have given valuable testimony as to the correctness of the tuberculin test; and would also have done much to educate the people to the fact that a very small percentage of the cattle affected with tuberculosis are unfit for food.—Wallaces' Farmer.

SILAGE FOR SHEEP AND HORSES.

Some years ago it was a common thing to hear people say that corn silage was of little value. In fact some would even assert that it was not equal to our other rough feeds. Now we find that the advent of the silo has continued, its value is fully realized by feeders in general. Dairymen understand its part as an essential in economical milk production. The majority of progressive dairymen here in Wisconsin have silos. And as it has proven itself a benefit to one class of live stock it is natural that men should reach out and seek to apply it to others. The internal mechanism of the cow is not widely different from that of a sheep or horse. A feed that a cow can assimilate at a profit should be valuable as a feed for other classes of live stock.

It does not pay to maintain a silo for cattle alone if silage can be adapted to the use of our other farm animals. It has been the subject of much thought, not only to use silage as a succulent feed but a chief ration for sheep and horses. The results of experiments in the feeding of silage to these animals are probably not as widely known as they should be. If they were it is my belief that farmers would derive added benefit from their silos.

There are always reasons why failure is pronounced on new discoveries, and we find this particularly applicable with silage. The first silos were built oblong giving great surface but little depth. This caused mouldy silage and silage which had become spoiled with contact with the air. This sort of feed proved a failure in most cases and the silo was not a success. But when the deep air-tight silo was brought into use the prospect be-

The Whiting Jersey Stock Farm Co.
Is making the very best strains of blood fresh from the island of Jersey a specialty. Whiting Jersey Stock Farm Co. Heber, Cal.

A Good Judge of Cows

is likely to be a good judge of a cream separator. The same quality of brains that enables a man to breed high-class dairy cattle, leads him to buy the best cream separator.

It is worth noting that the man who produced the World's Record Holstein cow

COLANTHA 4TH'S JOHANNA,

has a United States Cream Separator. This man is W. J. Gillette, of Rosendale, Wis.

And do you know that

JACOBA IRENE,

the great record-breaking Jersey cow, is owned by A. O. Auten, of Jerseyville, Ill., who uses the United States Separator on his farm?

Also the owners of the wonderful, $10,000 Guernsey cow

YEKSA SUNBEAM,

the Reitbrock estate, of Helendale Farms at Athens, Wis., use four United States Separators on their farms.

TWILIGHT LONAN,

Chas. L. Hill of Rosendale, Wis., owner of the celebrated Guernsey cow Twilight Lonan, uses a United States Cream Separator on his farm.

LORETTA D.

F. H. Scribner, of Rosendale, Wis., who developed the celebrated Jersey cow Loretta D., and who is one of the great Jersey breeders of the country, uses a United States Cream Separator.

If the **United States Separator** is the separator for these business men and thousands of others, leaders of the dairy world, **why not for you?** These experts—men who know, and do—require the use of a separator which **skims closest, washes easiest, runs easiest,** and **wears longest.**

This is the reason they all choose the United States Separator.

The United States Separator holds World's Record, therefore is the World's Standard Separator.

HAROLD SOMERS
150 DeKalb Ave.
Brooklyn, N. Y.

came much brighter. I believe that the greatest fault in silage making at the present time is the putting up of too much corn, the use of corn which produces great tonnage but does not get mature enough. This causes too much acidity which is detrimental for feeding purposes. Investigation would show that this sort of corn has been used in nearly every instance where failure has been pronounced. I might give a brief outline of our experience with corn silage the past twelve years in feeding sheep and horses.

The first year we filled the silo with whole corn, which was planted thick in the rows and harvested when just beginning to glaze. The leaves and stalks were filled with sap, being grown on rich, loamy soil. Although it gave us a very heavy yield, the results were not the best. We started feeding it cautiously to all of our sheep but when over one and one-half pounds were fed it had a laxative tendency and in some cases the younger growing lambs would appear sickly, showing papery colored skins and generally an unthrifty appearance. I might state that we fed clear hay and a ration of oats and corn in connection with the silage.

The following year a more mature crop was harvested, and as a result the apparent bad results of the previous year were eliminated, and a two-pound ration was fed, showing good gains and thrift in the entire flock.

Since the first two seasons our corn has been run through the cutter, not because we thought it made better feed but we could handle the crop at feeding time much easier with practically no more expense. We are now feeding sheep of all ages silage made from corn which has ripened enough for husking with the leaves partially dried. Pregnant ewes and young stock receive two pounds per head daily, and ewes, suckling lambs from two and one-half to three pounds with the best resuls. I believe we could profitably feed all of this well matured silage to our sheep that they would consume with excellent results. Where silage has been pronounced a failure as sheep feed, nine cases in ten it has been caused by filling the silo with immature corn.

The experiment stations have been doing excellent work in carrying on experiments with the feeding of corn silage in connection with other feeds to sheep. Among the most valuable are those carried on at Illinois, Indiana, Michigan and Iowa in most cases demonstrating that good silage was the most economical mutton producing feed when fed in connection with other feeds.

The Illinois station is now conducting a second experiment with corn silage for fattening lambs along the same lines as one completed two years ago at Illinois, five lots of 16 wether lambs each were selected, and silage fed in different quantities to each lot. Another lot was fed entirely on clover hay and corn. In every case the lambs having silage in their ration made greater and more economical gains than those fed on corn and clover, and in every case also the lambs fed the greatest amount of silage made the best gains.

These efforts are particularly valuable, because they have been long periods, demonstrating fully that there are no ill effects on the system of the lamb and mature sheep, which we find claimed many times, by people who are not feeding silage mature.

The Indiana Station, Lafayette, Ind., recently stated that silage was an excellent feed for sheep, being fattened for slaughter and also for pregnant ewes and ewes after lambing. This statement corroborates the experience of many practical sheep breeders.

Our experience in feeding silage to horses has been similar to that with sheep. The poor results from feeding sour, immature silage were apparent. Since the first year or two we have been feeding a liberal quantity to our work horses, brood mares and growing colts with good results. We have never fed heavily to growing colts or brood mares. However, some of our most progressive farmers have been feeding as high as 30 pounds per day to mares suckling colts. And others have fed silage and oats as an entire ration.

It has been fully proven that mouldy silage is dangerous. Pearson of Pennsylvania in investigating an outbreak where five horses had died, found mouldy silage had been fed. Wing also reports the deaths of eight horses feeding on mouldy silage. We see that, in view of such troubles, silage should be fed to horses only where sound intelligence is used. Our conclusion is that silage is one of the most economical and useful feeds for sheep and horses. When the corn is well matured and properly siloed, silage may be fed in almost unlimited quantities. — Wisconsin Agriculturist.

HARDY CATALPAS.

That the hardy catalpa is one of the best fence post trees that can be grown in Iowa, is the conclusion reached by the Iowa Experiment station. Eighteen year old trees that have been properly cared for will yield from 2000 to 2500 posts to the acre. The gross annual return per acre per year on the Iowa plantations studied varied from $10.77 to $20.34. Copies of Bulletin 120, giving complete directions for growing catalpas, can be obtained free by writing to the Iowa Experiment station at Ames.

A land rush took place in Yakima county, Washington, the last of March when claim shanties already constructed were driven to the lands, some of which were claimed to be worth $300 per acre.

GLANDERS.

By C. L. Barnes, Colorado Agricultural College.

Glanders is a contagious disease, caused by a specific germ. It affects horses and mules. Sometimes the goat, cat and dog contract the disease. Cattle and chickens are immune. The disease attacks the mucous membrane of the nose, but may extend to the trachea and lungs. When the lymphatic glands of the surface of the body are affected, the disease is known as farcy.

The disease may be transmitted to man by inoculation through wounds or on mucous membranes.

There are many ways in which animals may become infected, such as common drinking troughs, feed boxes, mangers, hitch racks, harness, and any equipment used around an infected stable.

Symptoms of Glanders.

Glanders may occur in the acute or chronic form, or it may attack the surface of the body in the form of farcy. The acute form of glanders begins with a chill, high fever, the mucous membrane of the nose is at first hot and dry, a watery discharge soon appears which later becomes bloody.

Nodules and ulcers form on the mucous membrane of the nose and discharge pus. Early in the attack of the disease the lymphatic glands of the lower part become enlarged, forming nodules and without any great amount of heat or tenderness and little disposition to form pus. If these glands have been swollen for some time there is a tendency for them to become attached to the jaw. In the case of acute glanders the termination is death, which takes place in from three to fourteen days.

In the chronic form of glanders this discharge from the nostrils is sticky and of a yellowish-gray or green colored pus mixed with some blood coming from ulcers on the inside of the nose. These ulcers are generally star-shaped and may extend so deeply into the septum as to cause perforation.

The swelling of the lymphatic glands along the lower jaw is even less sensitive than in acute glanders. These glands are hard, varying in size from a pea or bean to that of a small bird's egg, and have no tendency to break down into pus.

When glanders affects the skin, the nodules form along the line of the lymphatics. They have a tendency to soften and discharge pus, after which they heal rapidly.

Prevention of Glanders.

From the fact that treatment is not advisable, all glandered horses should be destroyed; all buildings occupied by glandered horses should be disinfected, as also should harness and stable equipment.

In order that one may be sure that horses are not affected with glanders all suspicious animals should be tested by a competent veterinarian.

DRAFT HORSES IMPORTED.

Complete figures have recently been compiled by the Percheron Society of America regarding the importation of draft horses through port of New York for the eight months extending from July, 1910, until March 6, 1911.

Practically all the horses imported into the United States are imported through the port of New York, the only exception being in the case of a few Clydesdales, which are imported through Canada.

Th› Percherons imported in that period were 1923 or over 65 per cent of all draft horses admitted. Belgians come second with 726 animals, Shires 215 with Punch horses and French draft making up the balance of 2900.

Horses known as French Draft are of the Boulonnais, Nivernais, Ardennais or Breton strains, as these or any of their crosses are known in France and in this country as French Draft and are distinct from the Percherons.

"MEN WHO KNOW"
USE THE
DE LAVAL
CREAM SEPARATOR

Does it not mean a great deal to YOU, the prospective buyer of a Cream Separator, that such men as

J. P. Morgan, the greatest of bankers
C. H. Mackay, Pres't Postal Telegraph Co.
J. M. Studebaker, the great wagon builder
Ex-Gov. Chas. W. Stone, of Pennsylvania
Sir Wm. Van Horne, Ex-Pres't Canadian Pacific R'y
Hon. W. B. Barney, Iowa State Dairy Commissioner
Philip Moen, the great wire manufacturer
Dr. J. A. Mead, Pres't Howe Scale Co.
Prof. W. H. Caldwell, Sec'y Am. Guernsey Cattle Club
U. S. Senator Knute Nelson, of Minnesota

and many others like them, good dairy farmers as well as great leaders in every sphere of human endeavor, each of whom is possessed of much personal experience and a thousand authoritative sources of separator information, are among the 1,250,000 satisfied users of DE LAVAL Cream Separators?

CONTENTS THIS WEEK

CALEXICO FLOWER GARDEN, Cover.

TREATMENT OF GUM DISEASE, 451.

HORTICULTURAL QUARANTINE WORK IN THE SOUTH, 451.

MUTUAL INFLUENCE OF STOCK AND SCION, 453.

DECIDUOUS FRUITS.—Leaf-Curling or Purple Aphis; What Colors the Apple; Winter Injury; Toll of Tall Timber; 454, 456.

HOME GROUNDS BEAUTIFUL—Street Tree Planting; Sick Acacias; Sea Lavender; Early Garden; 457.

LIVE STOCK AND DAIRY.—Tuberculous Cows; Silage for Sheep and Horses; Glanders; Draft Horses Imported; 459, 460, 461.

EDITORIAL.—Foods and Their Adulteration; Leave Us Alone; A New Navel Orange; Calico Eggs; Team Work; Hope for the Future; Editorial Notes; 462.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 463.

PRACTICAL POULTRY CULTURE.—Methods of Keeping Eggs; Poultry House Floors; Egg Grading; Desiccated Eggs; 464, 466.

IRRIGATION AND FORESTRY.—Moisture; Content of Soil; Eucalyptus; Duty of Water; Acres and Bonds; Wood Fuel Bill; 467, 468.

QUESTIONS AND ANSWERS.—Macaroni for Stock; Mistletoe on Walnuts; Record Holders; Squash Bugs; Aphis; Rough Skinned Oranges; Oranges on Alkali; Irrigating Trees in Bloom; Sulphuring Grapes; Fumigation vs. Spraying; Bloat or Hoven; Crop on Overflowed Land; Diseased Tomato Vines; Paraffining Orange Blossoms; Alfalfa Seed Production; Evaporator; Stock for Peach and Apricot; Remedy for Snake Bite; 469, 470, 471.

VETERINARY.—Splints; Soreness and Lameness; 471.

TIMELY RANCH SUGGESTIONS.—Work of the Grange; Formalin Treatment Prevents Smut; 472, 473.

HOUSEHOLD DEPARTMENT.—Easter; Origin of Easter Eggs; Easter Monday; Hot Tamales; Crullers; A Reminder; Are You Getting Anywhere; 475, 476, 477.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market; 478, 479.

FOODS AND THEIR ADULTERATION.

California fruit growers are sometimes not pleased at the mention of Dr. Harvey W. Wiley's name. He is Chief Chemist of the United States Department of Agriculture, and was responsible for the sulphured fruit ruling of a few years ago which caused such great loss to the fruit industry of this state. But if the fruit growers thought Dr. Wiley's ruling wrong, we believe they always gave him credit for perfect honesty in his belief. In his work in the Department he has done many things worthy of greatest praise. We refer to him at this time, however, to call attention to a revision of his book, "Foods and Their Adulteration," the second edition of this book, containing 100 pages of new material. It is truly a remarkable presentation of the origin, manufacture and composition of food products. Special attention is given to infants' and invalids' foods, and detection of adulterations. There are many colored plates and other illustrations. The book is sold at $4, and the publishers are P. Blakiston's Son & Co., 1012 Walnut street, Philadelphia.

The book is divided into eleven parts, with apendix giving food standards; also there is an excellent index. Part One treats of meats and meat products, Part Two of poultry, eggs and game birds; others of fish foods, milk and milk products, oleomargarine, cereal foods, vegetable condiments and fruits, vegetable oils and foods, nuts, fungi as foods, sugars, syrups, confectionery, honey, etc. A most interesting account is given of methods of manufacturing the most edible of oils, that made from the olive. This is given an extended description, as are also methods of adulteration. In the United States the principal adulterant of olive oil is cotton seed oil, which, as the book says, "is an ideal material with which to adulterate olive oil. This adulteration extends often to complete substitution, though represented as olive oil by both dealer and label." We will quote more at length from this book in later Cultivators. It is a valued addition to our library.

"LEAVE US ALONE."

We note a communication in the Florida Grower from an orange producer at Pomona, Florida, referring to the proposed horticultural law in that state which aims to create better fruit growing conditions by the appointment of a state horticultural commissioner and the control so far as possible of the spread of scale and other pests. The correspondent states that while such a law may do well in California, "conditions are altogether different here. Insect pests and diseases are scattered all over the citrus belt of this state, and to try to exterminate them by such methods as are provided in that act would be like trying to 'sweep the tide back with a broom.' We are paying too much tax now for the benefits we enjoy and I hope the lawmakers of this state will impose no more for such fool purposes. There are but few grove owners who are not trying to correct the evils which exist and in time I have no doubt will succeed as far as it is possible to do so without such a law to give fat picking to a few men who would use it more for their own benefits than for the grower."

If California fruit growers were of the make-up which delights in prosperity at others' expense, they could wish no quicker way of attaining it than that the writer of the above quotation should have his way in Florida. It is simply the old cry of wishing to be left alone no matter how much it may injure others in the same calling.

"THE NEW NAVEL ORANGE."

Attention was attracted by the use of newspapers all over the state to a fake article which started from no one knows where regarding a newly created navel orange coming from the conservatory of the Department at Washington, and being sent to experimenters in this state for its first trial. Merest mention was made of this in the Cultivator of a couple of weeks ago. The report from which the item was taken had some of the earmarks of yellow literature. We now have an article from the Department as follows:

"The attention of the Department of Agriculture has been called to a dispatch published in various California papers on the 9th and 10th instants stating that the Department had originated a new type of navel orange and that several thousand young trees were ready for distribution this month throughout California.

"These statements as published are misleading and are apparently based on a misapprehension of the facts. The Department has no new navel oranges nor new citrus fruits of any kind for distribution in California at present. Experiments in the breeding of new navel oranges and other citrus fruits have been under way for several years, but these experiments are still in the preliminary stage. None of the new sorts will be distributed until thoroughly tested under the auspices of the Department and found to be of promise. None of them has as yet fruited, therefore it is not known whether any will be of commercial value."

CALICO EGGS.

A correspondent in the Ukiah Times complains about the calico egg producers, especially because there are some in that section. But he adds a ray of hope in the fact that these producers of low-grade eggs have to accept a calico price. Storekeepers more and more are drawing the line between Number Ones and Number Twos. Number Ones in the San Francisco market are pure white, and each egg must come up to one-twelfth of twenty-two ounces. In the Los Angeles market whiteness is not so essential as regularity of color. Number Two eggs are of regular color, and must come up to eighteen ounces per dozen. Number Three eggs may be of any old color, and weigh under eighteen ounces to the dozen—and are hard to sell at any price. These Number Threes are thrown into cheap lots and sold off by the cheap corner groceries. We venture it costs as much to produce Number Threes as it does Number Ones, but the Number Threes fix the price of the whole lot which the farmers carry in. It is unwise to admit to the market such eggs, but few can understand it.

Los Angeles county bee keepers are concerned over the proposed shipment into that county of colonies of bees from the San Joaquin valley, thought to be infected with foul brood. County Bee Inspector De Sellem is working on the case and intends to keep the infected colonies out of the county if possible. This disease has not yet appeared south of the Tehachapi and the southern bee keepers, though they fear its introduction ultimately, mean to use every possible measure to prevent it.

TEAM WORK.

Referring to the necessity for team work, the Spokesman Review of Spokane lays down as a working rule three essentials: First, a working plan; second, a leader; third, workers pulling together; and adds that the lack of any one of the three means failure. A whole sermon might be preached on this point, no more forceful than this short statement. Perhaps the most difficult of the three essentials to work out is the last. The plan may be determined, the leader chosen, but to get all the workers to unite is a problem. We are all so self-centered that to give way in cooperation and "let others handle our business" goes against the grain; but unless you can do it, don't try co-operation.

HOPE FOR THE FUTURE.

The time is past when ignorance can succeed in any vocation and especially is this true of the great profession of farming. Intelligent farming means profitable farming. When this end is attained then the cry "back to the farm" will have been answered, for when the farmers are really and truly prosperous they will naturally surround themselves with all of the comforts of the present age; country home life will then be the happiest, most attractive and independent on the face of the earth.

Assembly Bill No. 965, introduced by Assemblyman Cogswell and passed by both houses, was signed by the Governor on March 24. This is an amendment to the act empowering boards of supervisors to appoint county horticultural commissioners. The amendment provides that the supervisors, if petitioned by twenty-five or more persons, possessors of orchards, greenhouses or nurseries, shall appoint a commissioner to supervise destruction of insects, diseases and pests, enforce county ordinances and state laws relating thereto. As by the former law, the state board of examiners is empowered to examine applicants for fitness for the office. The term is to be four years. The person appointed must be qualified for his duties, and must be chosen from a list of eligible persons recommended by the examining board and within thirty days from receipt of said list. The former law placed the power of appointing the examining board in the hands of the Governor; the amendment changes this, and states that the board of examiners shall consist of the dean of the Agricultural College of the University of California, the state horticultural commissioners and the superintendent of the state insectary. This board shall consult the resident horticulturists in determining the responsibility and moral qualifications of candidates. The salary of inspectors appointed by the county horticultural commissioners shall be $3.50 per day, deputies $5, the commissioner to receive $6. The commissioner and his deputies are allowed traveling expenses, but the inspectors are not.

The Holstein-Friesian Association of America offered to add 15 per cent to the cash prizes awarded by the California State Fair in sections where Holstein-Friesian cattle may compete, all animals expecting to win this additional prize to be registered.

The Riverside Enterprise suggests that there is no book on citrus culture which is worthy of that great industry. There is a prime need for someone qualified to take up this great work and give to the industry, which brings to the state more than $30,000,000 a year, a complete treatise.

Agricultural News Notes of the Pacific Coast

Northern California

Butte county is planning a thousand acre dairy farm.

A horseradish farm is being established at Yuba City, Sutter county.

A new fruit packing house is to be erected at Newcastle, Placer county.

A Stockton factory is sending traction engines to the Argentine Republic.

Four hundred thousand hop plants are being planted at Nord, Butte county.

Asparagus canneries are preparing for an opening run within the next few days.

A brooder house at Santa Rosa with 1800 young chicks went up in smoke last week.

Anderson, Shasta county, observed last Saturday as general clean-up day of its streets.

Live Oak, Sutter county, is taking steps to secure the establishing of an alfalfa meal mill.

The Sutter County Farmer reports orchards and vineyards in exceptionally fine condition.

Vacaville reports promise for a good crop of apricots, cherries, peaches and plums.

Vacaville, Solano county, reports apricot crop lighter and cherries being injured by thrips.

The asparagus canning factory at Rio Vista, Solano county, will start within the next few days.

A Los Angeles gardener has purchased land near Yuba City and will grow horseradish extensively.

Some vineyardists of Mendocino county have received offers of $15 a ton for a period of ten years for wine grapes.

Residents of Alvarado, Alameda county, are petitioning the board of supervisors for protection against storm water.

The California Almond Exchange will deal directly with Eastern brokers for the handling of the coming season's crop.

Irrigators near Woodland, Yolo county, held a meeting and discussed matter of rates for water during the coming season.

Heads of fruit distributing houses at Sacramento report that a general canvass of the fruit situation of the Sacramento Valley indicates a large crop of all kinds of fruits.

Ferndale, Humboldt county, has a poultry ranch which is now occupied by 1100 laying hens and has proven remarkably profitable. Eight incubators are in constant operation.

The Hughes Chicken Colony has purchased a tract of the Schell Ranch at Schellville, Sonoma county, and has placed an order with the Schellville Hatchery for 12,000 chicks.

Horticultural Commissioner Stabler of Sutter county advises immediate sulphuring of almond trees and a second sulphuring 1st to the 10th of May to aid in the control of red spider.

The Plant Introduction Garden at Chico, Butte county, is supplied with several tons of rice seed of 45 different types which will be distributed to those who will give it careful attention in the Sacramento Valley.

Central California

Woodville, Tulare county, reports grain and alfalfa growing like magic.

The last legislature appropriated $150,000 for a normal school at Fresno.

The Stanislaus County Bee Keepers Association met in Modesto last Tuesday.

A Visalia dairyman has been fined $75 for keeping his dairy in a filthy condition.

It is proposed to create a magnificent boulevard from San Jose to San Francisco.

A meeting was held at Lindsay last week to discuss campaign against orange thrips.

A $60,000 factory for fruit preserving is to be constructed at Lodi, San Joaquin county.

The peach and apricot crop of the San Joaquin valley will be much lighter than last year.

About 325 rabbits were slaughtered in a rabbit drive in the Central district, Stanislaus county.

Pear thrips are doing less damage in the prune and other deciduous orchards of Santa Clara valley.

An artesian well showing a flow of 75 inches of water was recently completed on a ranch near Tulare.

From investigations of the apricot orchards of the Pajaro Valley it is believed a bumper crop will be given this year.

The squirrel inspectors of Stanislaus county have all been taken off the job and the campaign is at a standstill.

Thirteen counties were represented at the meeting of poultrymen in San Jose last week to form a state poultry association.

Bonds of $200,000 par value will be offered for sale by the directors of the Turlock Irrigation district on April 24th.

Secretary Bremner of the state horticultural commission reports much damage from pear thrips along the delta lands.

Many peach orchards are proving to be seriously affected with peach blight, this of course only in orchards not sprayed.

During an electric storm at Los Gatos, Santa Clara county, last week a bolt of lightning destroyed a large cypress tree.

Some farmers along the west side of the San Joaquin valley are contemplating large experimental plantings of cotton.

There was no meeting of the San Jose Grange last Saturday because of the entire membership attending the Saratoga Blossom Festival.

A Fresno man has invented a fruit cutting machine said to handle peaches and apricots much more economically than former methods.

The portion of the Sierra Nevada supplying water to Kings, San Joaquin and other rivers of the valley is said to be covered with a third more snow than a year ago.

Ranchers at Porterville who use electricity for power are conferring with the power company and hope to perfect arrangements by which extensive developments along power lines may be taken up.

Southern California

Santa Paula observed last Friday as annual clean-up day.

El Centro, Imperial Valley, is to hold a street fair April 10 to 15.

Orange County Poultry Association is planning for a big show in December.

Fullerton boasts of one of the largest chicken hatcheries of Southern California.

The Fullerton-Placentia district of Orange county will ship about 1600 cars of oranges.

Plans are already being laid for next year's National Orange Show at San Bernardino.

Oranges are still showing much decay and shippers are appealing for more care in picking.

Imperial Valley estimates approximately 4500 acres of cantaloupes have been planted this season.

Rialto and other western San Bernardino county points are having experience with horse thieves.

J. C. O'Neal, of Indian Wells, in the Coachella Valley, is making weekly shipments of peas to Los Angeles.

Fullerton cabbage growers are pleased at price prospects; that district will ship about 200 carloads.

The Whittier Citrus Association anticipates a million and a half dollars as return for its shipments this year.

Orange, San Bernardino, Riverside and Imperial counties claim a valuation of $9,000,000 in irrigation canals.

Horticultural Commissioner Beers of Santa Barbara county reports the planting of olive trees very extensive.

Poultrymen of Escondido, San Diego county, met last week and formed a county association, 15 members signing the charter.

Bean growers of Orange county claim they are getting far better prices than before co-operation was brought to their aid.

Many mules and horses owned by contractors near Santa Monica, Los Angeles county, have been lost because of spotted fever, or spinal meningitis.

The manager of the Lima Bean Growers Association of Ventura County reports prices for September and October delivery on a five cent basis f. o. b. Coast.

Hundreds of teams are doing development work in the Chucawalla Valley in anticipation of the water to be brought in by the Chucawalla Development company.

Orange county cabbage growers report tonnage per acre lighter than last year; it is feared it may be from three to five tons, whereas seven to eight was anticipated.

Owners of property along the San Gabriel river are forming a combination to commence suit against Los Angeles county because of damage to their lands during the recent floods.

The signing of the bill passed by the last state legislature appropriating a quarter of a million dollars for a California state building at the Panama-California Exposition to be held at San Diego, was accompanied with some ceremony, and the pen was a gold one mounted on a large ostrich plume quill.

The Coast

Oregon City Horse Show will be held April 22nd.

Hundreds of colonists are locating near Albany, Oregon.

Seattle egg market is now at 22 cents for local extras.

Spring plowing has been started in Flathead county, Montana.

Varieties of almonds are being tested in Hillsboro, Oregon.

The governor of Montana has proclaimed May 19th as Arbor Day.

Western Oregon reports that March of 1911 was the driest March since 1885.

Cold storage men at Portland report the apple market as exceptionally strong.

A number of new Granges have been organized in the state of Washington.

The governor of Montana has appointed a board of live stock commissioners.

Spokane, Washington, reports since the first of April genuine summer weather.

Pumps to supply water for irrigation were started at Hanford, Washington, on March 30th.

Twenty-five hundred acres of orchards will be planted at Prosser, Washington, this spring.

Montana farmers are looking for a great crop of grain, the winter having been most favorable.

Nine associations of fruit growers are uniting in a central selling agency to cover all the Northwest.

California leads the United States as a barley producer, Minnesota having formerly held the honor.

Foresters from various coast sections conferred with Chief Forrester Graves at Salt Lake City last week.

Umatilla county, Oregon, farmers are paying seven cents for grain sacks as against six cents last year.

The live stock market in Portland is reported remarkably dull because of generally poor condition of all offerings.

Farmers of Nevada and Montana maintain that they pay the highest average farm wage of any portion of the country.

The high school at Pasco, Washington, is being conducted on the centralized plan, busses carrying children from the outlying districts.

A famine of spraying material has been brought on in the Yakima Valley, Washington, because of the general campaign on the part of all fruit growers.

The reclamation service is to construct a dam at Lake Kaches near North Yakima, Washington, which will impound 210,000 acre-feet of water.

The Moro Province Fair held during late February at Zamboanga, on the Island of Mindanao, P. I., was declared a complete success; a good agricultural exhibit was made.

Orchardists of Spokane Valley, Washington, have organized the Spokane-Highlands Fruit Growers Association. The association will become a member of the Northwestern Fruit Exchange.

Good Tools Make Good Workmen

Farmers! Increase the efficiency of your men by giving them good tools. Don't expect raw hands to do as well with misfit tools as they would with well made, handy

KEEN KUTTER
Farming Tools

A workman is largely what his tool makes him. Therefore, see that the hoes, forks, rakes, scythes, shovels, spades, garden forks, axes, manure hooks, potato hooks, and other hand tools which your men use bear the Keen Kutter trademark. One of the best Keen Kutter tools made is the Keen Kutter Drain Cleaner. Forged from one piece best crucible steel, hardened and polished. Beveled for either pulling or pushing. Fitted with 6 foot Northern Ash handle.

Cycle Hatcher Co., Oakland, Cal.
Gentlemen: A year ago we started with the Philo System, and raised as fine a lot of White Orpington pullets as anyone would wish to see. The two machines we purchased of you last season have given excellent satisfaction. We shall probably need more this year, and shall use the Cycle machines in preference to a larger incubator. Yours truly, S. N. Haines

Practical Poultry Culture

METHODS OF KEEPING EGGS.

By Mrs. A. Basley.

"Thank goodness, eggs are cheaper!" exclaims the housekeeper, while the egg-farmer shakes his head as he thinks what a price he might have realized if the hens had only laid more eggs a few months ago. Thrifty folks when eggs begin to be cheap plan to preserve them in some way so as to have eggs in the late fall and winter when the price soars high, and the eggs are few.

"What do you consider the best way of keeping eggs for use next winter," asks one of our readers. Personally I have tried the following ways: first standing them on the small end and covering them with salt, well sifted through and around them; results fairly good, at least at the end of six months they did well for cooking and very few were bad. Packing them in bran: poor results, a good many were entirely lost and some were mouldy in taste. Greasing them with butter within a few minutes after they were laid: these kept very well as a rule, that is, if they were greased all over with really good salt butter and before they were quite cold after they were laid. They kept six months well, and at three months could not be known when boiled from the eggs laid the previous day. I tried this plan as had my mother for many years, but it was a good deal of trouble. The next plan was keeping the eggs in lime water. This was very fairly satisfactory, the best and cheapest until the waterglass method was discovered.

Undoubtedly the best way of preserving eggs, so that they will at the end of six or nine months be almost as fresh as when newly laid, is to put them into a solution of waterglass. Waterglass, so-called, is "silicate of soda," sometimes called "dissolved glass." This last term describes just what the stuff is. When we buy it by the pint, quart or gallon we get dissolved glass. If we buy it dry, we get a soluble glass powder, which looks sometimes like powdered stone and sometimes white and glass like as to its particles. The powdered forms are supposed to dissolve in boiling water, but they frequently have to be boiled for hours before they will dissolve, and I have found that the most satisfactory is that which comes from the East in cans. I usually buy a gallon can at the beginning of the season. This is sufficient to preserve about sixty dozen eggs. The price of the "waterglass" varies, as many commodities do. I usually give about 85 cents a gallon, but on inquiry at a large drug store this week, I find they are selling it at 75 cents a gallon or 50 cents for half a gallon, or 25 cents for a pint. The stuff is very much like glucose in appearance. It is a thick, jelly-like liquid and is usually white, at least, that which is used in this part of the country is. One of our readers wrote me that some he had bought is watery. It should not be more watery, until after the water is added, than glucose or molasses.

If you cannot get such as I describe of your own druggist write to any poultry supply house which advertises in these columns.

Directions for Use.

Use pure water which has been thoroughly boiled and cooled. To each quart of this water add one quart of waterglass. Pack the eggs in the jar and pour the mixture over them. Or the solution may be placed in the jar and fresh eggs added from time to time until the jar is filled, but care must be used to keep fully two inches of solution of waterglass to cover the eggs. Keep the eggs in a cool place and the jar covered to prevent evaporation. A cool cellar is a good place to keep the eggs, but a neighbor of mine kept his under his north porch, covered to keep out dirt and insects.

If the eggs are kept in a place that is too warm the silicate will be deposited and the eggs will not be properly protected. Do not wash the eggs before packing, for by so doing you will injure their keeping qualities, by dissolving the mucilaginous coating on the outside of the shell. For packing use only perfectly fresh eggs, for eggs that have become stale before packing cannot be preserved by this or any other method. You cannot make a stale egg fresh again, and one stale egg may spoil the whole batch in the same receptacle.

I have kept eggs preserved in this manner for over eight months, and have no doubt that I could have kept them a full year in as fresh a condition had we not eaten them, for I found them to all appearance as fresh as if not over a week old.

The Kind of Vessels for Packing.

The best vessels are jars or crocks with a cover to them, but I have found that I could keep the eggs almost as well in tin receptacles. I have used five-gallon kerosene oil cans and large lard pails. These kept the eggs perfectly, but after a time the water and silicate of soda rusted the can in spots and the red rust formed a sediment on the eggs. This did not injure them as far as I could see, except giving the eggs a brownish tinge, and on my consulting the druggist he said that as the silicate of soda came from the East in tin cans he did not see why tin could not be used to hold the eggs. If tin receptacles are used do not paint or oil them, as the soda has an affinity for oil and will eat through it and the oil or paint may impart a disagreeable flavor to the eggs.

Professor Ladd of the North Dakota Agricultural Station in his bulletin mentions receiving complaints that barrels were not proving satisfactory, the waterglass appearing to dissolve some product which deposited on the eggs. He thinks that this might be attributed to the presence of glue, or sizing in the barrel. Altogether the preference seems to be for glass or stoneware vessels.

Professor Ladd's statement as to the satisfactory results of the waterglass method is very strong. He says: "This method has been tested in a commercial way, in nearly every state and part of our country, and we have not had to exceed eight adverse reports." One of the stations affirms that the failures reported are probably due to receiving waterglass of poor quality.

As the entire processes of preservation are an effort to fence out germs, the recommendation not to wash off the mucilaginous coating which nature puts on the eggs, and to use only

Here is a page of vital interest to every poultry raiser in California.

—It is to your interest to read it.

The Poultry Season is now at its height. Chicks are well under way and returns from market sales and egg production from the young flock are in sight. But the question is always uppermost in the mind of every poultryman, "Am I getting as much as I should from my birds?" It is only by comparison that one can determine whether or not the full capacity of eggs is produced or whether marketable poultry is at the right weight at a certain age.

Aside from good stock to start with, which is always necessary to success with poultry, the one fact standing out above all others is the quantity and quality of food supplied. Egg production consumes an enormous amount of vital energy. It is the bird's best effort. It is her real object; her life work, and she does it as well as she can under the conditions to which she is subjected. If you expect your flock to be a financial winner you should equip it with the proper fuel. Food is to a chicken what coal is to a boiler. The right kind will produce satisfactory results; the wrong kind will clog up the pipes.

WE ARE FUEL DEALERS. We supply the proper fuel for your chickens, and have a complete assortment to meet every requirement, both as to age and ultimate disposition of your birds.

THOUSANDS OF POULTRYMEN HAVE FAILED because they did not furnish the proper nourishment to their birds. BUYING A CHANCE FOOD IS DANGEROUS; MIXING YOUR OWN FOOD IS A RISK. YOU CANNOT AFFORD EITHER ONE OF THESE.

For a good many years we have devoted time and money to the preparation of proper food for chickens. Our business has increased from year to year, and we are at the present time by far the LARGEST POULTRY FOOD MANUFACTURERS IN CALIFORNIA. By our tremendous output we are able to keep a close watch as to results and we find that IN EVERY CASE our food has brought chicks to a standard of laying and marketable growth which has produced millions of dollars for the poultry raisers of the state.

The opportunity for poultry success is greater than ever before. The demand is good. If you are raising a few chicks you can increase your holdings and be sure of success.

We have prepared a new book called "CHICKENS." It is a concise and plain guide for the man who wants to raise chickens for profit. It gives every detail from the selection of the breed to the selling of eggs. We have only 5000 of these books. To that extent we will send one free to every reader of the Cultivator who writes for it. This book is intended mainly for beginners, but will be found attractive and interesting to poultry raisers, large and small. It deals with the problem from the standpoint of California conditions, and for this reason is especially useful and practical. You may have one of the five thousand if you want it.

Our foods are on sale by all reliable poultry supply houses. If you would like a sample we will gladly send it, and give you the name of our nearest agent.

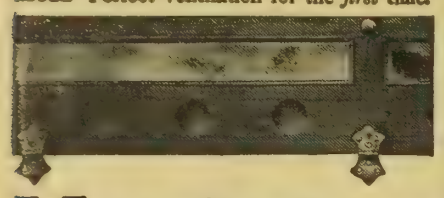
More Inventions by Lee

Here's his new Incubator door all are talking about. Perfect ventilation for the *first* time.

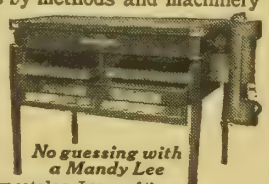


Mandy Lee Incubators

supply life-giving oxygen freely to the eggs and just as naturally draw off the poisonous gases. The most important step ever taken in incubator ventilation—neither above nor below, but *right at the eggs*—the correct principle, for the new Mandy Lee is making better hatches of *stronger* chicks than any other incubator in the world.

We Measure Everything

Heat—moisture—ventilation. You *guess* at nothing. If the eggs are good and you follow simple directions your work with a Mandy Lee is as nearly an absolute certainty as anything can be. There is no more reason why you should buy an incubator that regulates nothing but heat than for a farmer to continue to harvest his crops by methods and machinery used 100 years ago. Your success with poultry depends on your ability to select equipment that is *right*—that's what you *always* get from us.



No guessing with a Mandy Lee

Send *to-day* for new catalog. Learn of these new improvements and of our new *out-door, lamp-heated* and *regulated brooder*, just what is needed.

National forests of Arizona cover 15,000,000 acres.

boiled water, appears very logical When we know just what we are aiming at, we are less likely to omit the little precautions which otherwise might seem like the whims of some fussy person. Too many people skip the essentials when trying to follow a formula.

Eggs preserved in waterglass will keep good after they have been removed and wiped off, about as long as if they had been freshly laid; at least mine did. All preserved eggs contain a little gas and when boiled they will be apt to crack open unless previously pricked through the shell at the large end.

POULTRY HOUSE FLOORS.

During the sixteen years or more I have made poultry keeping a business I have spent a lot of time studying the problem of good floors in all kinds of poultry houses. At one time I was sure that a clay floor, well tamped and a few inches higher than the ground outside the building was about the best that one could have as well as the cheapest. In a small house where not a great many birds are kept I found it to be a good floor. True, it gave up a great amount of dust unless the litter on it was so deep that the hens could not find the bottom of it.

Dusty hen houses are an abomination. Then in turn I tried cinders for a floor. This was better than clay. Later I put in board floors made of cheap shiplap, and set the house up off the ground so that a dog or cat could get under the floor and keep out rats or mice. It did not work too well and was very expensive. I could not get a cat to do its rat catching under the floor, and was never able to learn why it would dig out even when fed regularly and given every inducement to stay and fight the vermin.

Next I tried a cement floor. This was first filled in with common dirt and packed or left to settle well, then I placed a couple of inches of cinders or gravel on top of this and wet it down and put in a floor of five parts sand and one of cement. This cement was laid two inches thick. It is plenty heavy for such purposes and will not break or crack if heavy pounding is not done upon it.

Be sure to have the base of the cement floor laid higher than the ground outside, as this will keep the foundation dry. This is what the cinders and gravel are for. I am told by cement men that common dirt if filled in well and packed will make good base for a floor that is used no more than one in a poultry house. The idea is to keep the dampness out from under it and to have the base packed well.

Cement will prevent rats from digging under the sides and getting into the flocks. It will be easily cleaned and is sanitary. The average poultryman can put in a cement floor for himself if he gets a man to mix the "mud." It must be well mixed when dry and then as well mixed after the water is put on it. Put it in thin, that is relatively thin. I mixed mine a bit thinner than common mortar would be mixed and it set together well and is making a fine job. I took a straight edge and set it at both sides of the house, filling in the mud and leveling each couple of feet as the job progressed. Then the day after it was put in and had set pretty well, I sprinkled it to keep it from drying too fast. Fast drying will crack the surface.—Journal of Agriculture.

EGG GRADING.

Mr A. G. Philips of the Purdue University Agricultural Experiment Station writes regarding detecting bad eggs as follows:

Not long ago it was stated that the eggs in Indiana were not bought according to quality, but at a flat rate of so much per dozen. However, when these eggs are received by the buyer, he is compelled to go over them and select the best eggs for his best trade.

Candling Eggs.

The method used for this selection of eggs is called "candling," or "testing." The "egg candle" or "tester" is made of wood or metal and, as a rule, is kept in a dark room. A light inside the tester shines through an opening, in front of which an egg is held by the candler. By a quick movement of the hand, the condition of the contents of the egg is quickly noted and the egg is placed in its proper class. A good candler works rapidly and will test a large number of eggs in a day.

Grading Eggs.

Eggs are sometimes graded as follows:

Extras: Weight 28 to 26 ounces, naturally and absolutely clean, fresh and sound, same color. (A grade seldom used).

Firsts: Weight 26 to 24 ounces, fresh and reasonably clean.

Seconds: Shrunken, stale, washed, stained and dirty.

Checks: Cracked, not leaking.

Rots: Incubator, blood rings, dead germs, and decomposed eggs.

All eggs should be bought and sold on this grading system so that an egg will bring what it is worth.

Description of Egg Contents.

When the candler tests the eggs he bases his judgment on the following indications:

Fresh: Opaque, appearing almost entirely free of any contents, sometimes dim outline of yolk visible, air cell very small

Stale: Outline of yolk plainly visible, sometimes muddy in appearance, air cell very large.

Developed Germ: Dark spot visible, from which radiate light colored blood vessels.

Dead Germ: Dark spot attached to shell, or red ring of blood visible.

Rotten: Muddy or very dark in appearance, yolk and white mixed, air cell large and sometimes movable.

Cracked: White lines showing irregularly in shell.

Testing as above suggested will aid one in determining absolutely, the quality of the eggs, not only for marketing, but for incubation. The farmer should demand that his eggs be bought upon the test. The buyer should co-operate with farmers and meet such demands by buying "loss off."

Recent changes in the pure food law make it unlawful to sell or offer for sale, eggs which are putrid, decomposed, rotten or unfit for food. The only way to obey this law is to sell eggs upon the grade.

DESICCATED EGGS.

Eggs put up in bulk, either frozen or dried, have disclosed in a number of instances the presence of decayed and filthy substance, showing plainly that either purposely or through carelessness spoiled eggs are broken into the cans. A number of notices of judgment have been issued in such cases, and it was deemed wise to make a thorough inspection of egg-packing establishments, observing the procedure from the candling of the eggs to the finishing of the product, and accompanying the inspection with the sampling of the output at various stages for the making of chemical and especially bacteriological examinations. It is obvious that the main consideration is the use of fresh material under sanitary conditions, but it was also developed that some of the details of handling in various packing houses result in lower bacterial counts and a better product than others, and suggestions will be made along these lines.—U. S. Ex. Sta. Record.

Keep the pullets gentle so they may be handled whenever this is necessary. When they are designed for mothers, time and trouble is saved by handling the hens.

Irrigation and Forestry

MOISTURE CONTENT OF SOIL.

By R. L. Parshall, Colorado Agricultural College.

Irrigation is as old as the hills, and is artificially supplying moisture to the soil for the growth of plants. In all these years the science of irrigation has not been made exact. Nature is so varied that irrigation must be made to meet the existing conditions.

Soil is composed of minute particles, irregular in appearance, and, when collected into a mass, there is a certain part of this that is space, and in this space water may be stored. It is this water so held in the soil that is useful to the growth of plants. A certain crop must have a certain amount of moisture for its needs; too much may be detrimental; not enough may cause the loss of the crop, but fortunately the limits are wide. The particular question always arises: What is the required amount of water for a maximum yield?

We find that soils differ in their make-up; different subsoil; the slope of the ground varies in different localities, and general climatic conditions may be different. All these considered, it may be said that what would be the proper amount to supply in one case may be too much or not enough in other cases. Efficient irrigation consists in supplying the requisite amount of moisture to the soil, and this may be accomplished by adding water to the ground, or regulating the drainage. It has been said that good plant growth will result if we have one pound of free moisture in the soil to about ten pounds of soil. This, of course, is general, and depends upon the kind of soil and the kind of crop.

You might make a test and determine for yourself the right amount for your farm and particular crop. First, select a place in your field where the plant growth seems to be best. Take from the roots of the plants a sample of the soil, which should be an average from the top roots to the lowest roots. Place this sample immediately into sealed jars of known weight. Weigh the jars and contents and the increase will be the true weight of soil and moisture. Put the soil in a pan and place in an oven of moderate temperature for several hours. When cooled to the temperature of the room, weigh again. The difference between the weights of the damp soil and the dry soil will give the weight of free water, or moisture that is available for the growth of plants.

EUCALYPTUS.

Mr. E. F. Adams is perhaps overconservative, however we think he is much nearer correct than promotion concerns which claimed profits beyond all reason from the planting of eucalyptus in California. Mr. Adams says in a recent Chronicle:

The ablest and most experienced lumbermen of this state have great confidence in the profit of eucalyptus growing in this state when done under proper conditions, but they also believe that nine-tenths of the planting done by inexperienced men under boom inspiration will represent so much wasted money. They probably doubt the wisdom of devoting first-class agricultural land to any such purpose. The conditions of profit are, first, ample capital which can afford to wait many years for returns. The twelve or fifteen year cycles which are suggested in the boom literature will not do at all. They will produce only immature wood almost impossible to handle on account of its warping and checking. Probably fifty years is the least it is safe to count on. Secondly there must be an ample area in one ownership, so as to produce a real forest. One of our wealthy and experienced lumbermen, who is himself considering a large investment in eucalyptus, recently told the writer that he would not even consider a proposition of planting less than 30,000 acres. Eucalyptus is a difficult wood to handle, and the area at command of a lumbering company must be large enough to justify the installment of a large and costly plant, which means the assurance of a supply of properly grown timber sufficient to last a good many years. Finally, it is not probable that the cost and risk of creating real forests of eucalypti will be assumed by experienced and competent business men until our methods of taxation are so changed that the tax on timber is paid when it is cut. If land and growing timber are to be assessed on such values as popular outcry would probably insist upon and then taxed at from 1½ to 2 per cent for forty or fifty years, it is evident that at compound interest any possible value would be used up long before the timber is mature and fit to cut. We clip the following from a recent document of the forest service:

A great deal of attention has recently been focused on the planting of eucalyptus in California. Many companies have been organized, much capital has been invested and the large acreage already planted is being rapidly increased. The forest service has sought to aid eucalyptus growers by publishing such information concerning the tree and its uses as it could secure after careful study.

Information presented for this purpose has at times been misused. Short passages have been quoted in such a way at times to convey a misleading impression and sometimes even to falsify the original meaning. Extravagant estimates of the probable returns from planted eucalyptus have been widely circulated, and there is reason to fear that many persons have formed an altogether false idea of the merits of eucalyptus growing as a field for investment, and have supposed that this false idea was justified by statements and figures of the forest service.

The truth is that there are as yet too many elements of uncertainty involved to permit a close calculation of money returns to be made. There is, however, every reason to believe that under proper conditions eucalyptus growing will be profitable. In eucalyptus growing as in any other class of commercial operations the investor needs to know not only whether the enterprise into which he thinks of putting his money is financially sound, but also how large a return is probable. It is the aim of the forest service to aid those who wish to know as nearly as possible what can be counted on by finding out and making known both what the tree will yield in wood and what uses the product will be suitable for. One of the ele-

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 30 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

ments of uncertainty is the value of the wood for high-grade purposes.

The problem of utilizing eucalyptus wood readily and without undue waste is a difficult one because of its tendency to warp, shrink and check in drying. In wood from trees as young as the California growers generally count on cutting this tendency is much stronger than in the wood from mature forest-grown trees in Australia and Tasmania. In the hope of finding means of controlling this tendency and for the further purpose of ascertaining the mechanical properties of eucalyptus wood, so that its industrial usefulness may be determined, the forest service has recently carried out, in co-operation with the University of California, a series of tests of several of the more common California species.

DUTY OF WATER.

How many farmers are there in the country who know what is meant by the term "Duty of Water?" Not many. Yet they have been living in an arid section and irrigating their fields for years. They have seen the value of water increase year after year, and they know that water in a reservoir is like money in a bank, and should be used when and where it will do the most good, and made to go as far as possible.

One farmer uses a certain head of water and with it covers five acres of his farm in a day. Another farmer uses the same head and irrigates only 2½ acres with it. The duty of the water in the hands and on the land of farmer No. 1 is double the duty in the hands and on the land of farmer No. 2.

It behooves every farmer, then, to know what duty he is getting out of his water, and, if he finds that he is not up to the standard, he may take the necessary steps to improve the position of his ditches or may, during the fall and early winter, cut off the high spots and fill in the low spots of the field and in this way increase the duty of his water two, three, and even fourfold.

There are two general ways of speaking of the duty of water. One is to state the number of acres a second foot of water will take care of, and the other is to speak of the number of acre feet of water used per acre.

We used to figure that land in this section needed one second foot of water for every 40 acres, and in this case the duty of water was 40 acres per second foot. Later we raised this duty to 60 acres per second foot; then we made the duty 80 acres per second foot, and for a long time it was the custom to provide a second foot of water for each 80-acre tract. Now we are figuring the duty of water to be 100 or 120 acres per second foot.

Can we do better than this? We certainly can, for in Southern California, where water is scarce and valuable, they make a second foot of water take care of 300 acres, and where subirrigation, by means of underground pipes, is used, the duty in some cases has reached 1000 acres per second foot.

This method, however, of figuring duty is not the best by any means, for it presupposes a continuous flow of one second foot throughout the irrigating season. The farmer when he irrigates usually wants more than a second-foot head, and he uses it for a few days or weeks and then uses no water at all for a period. Hence, the second way of stating it, which is in acre feet per acre, is usually the best way.

A second foot of water running for 24 hours delivers approximately 2 acre feet. (To be exact it delivers 2 acre feet in 24 hours, 12 minutes.) Let us say the irrigating period is 120 days, and one second-foot would deliver in that time approximately 240 acre feet. If this were applied all at once to 100 acres, it would cover it to a depth of 2.4 feet, and we would say that the duty of water in this case, is 2.4 acre feet per acre.

The duty of water, then, in acre feet per acre, is the number of acre feet of water applied to each acre of land, during the entire season. It varies the country over from 1 acre foot per acre, to 10 or 12 acre feet per acre.

Why not make an experiment, then, Mr. Farmer, and see what duty you are getting from your water? It will pay you.—E. B. House, Colorado Agricultural College.

ACRES AND BONDS.

The reclamation act of a few years ago gave permission to establish power plants in combination with irrigation works. In some of the United States Reclamation Service schemes, notably the Salt River Valley project, the power possibilities have been fully taken advantage of. The decision that water belongs to the land has settled former differences between companies owning canals, companies owning water rights, and land-owners. Now it is one great company of farmers and owners, where each acre of land represents one share of stock in a great concern to distribute not only water but that other great commodity "electricity." At a very low estimate, the revenue from each electrical horsepower, will net $50 per year, and the development of 27,000 h.p. would mean a revenue of $1,350,000 annually. This amount distributed over 240,000 acres of land brings a return of over $5 to each acre, each year.

When Colonel Roosevelt dedicated the Roosevelt dam, he officially approved of the great works that are nearing completion, for the generation of a total of 27,000 hydro-electric horsepower. The Salt River Valley farmers have added another product to their already very varied crops. From oranges and dates to alfalfa and cantaloupes they have a long list of growing things, nearly every semi-tropic fruit and vegetable can be listed. It is something of a feature to produce such a variety but they now include quotations on electricity with margins on kilowatts.

OUR WOOD FUEL BILL.

The annual wood fuel bill of the United States is $250,000,000, according to the latest estimate of the forestry department.

This is an enormous sum, and at first hearing seems to spell the doom of the forests. Yet since 1880, when the population of the land was only 50,000,000, and the consumption reached $322,000,000, coal has taken the place of wood, so that now only about 86,000,000 cords are used for fire. Of this a little more than 80 per cent is consumed in towns of from 1000 to 30,000 population, and about 17 per cent in the larger cities.

Our rapidly increasing growth does not mean, therefore, a corresponding destruction of the forests.—Journal of Agriculture.

However, isn't it the part of wisdom for all when there is a possibility of doing so to grow their fuel supply?

John Hayes Hammond, the American mining engineer and promoter, is reported to be making extensive investigations in Russia to direct investments in irrigation and public utility companies. It is claimed that the Russian government will encourage the American enterprise.—Irrigation Age.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Macaroni for Stock.

Please tell us through your columns as to feeding of calves and heifers on macaroni. We understand that this is very good feed and would like to know the amount to feed and how to feed it.—Subscriber, El Monte.

I have been unable to find any direct analysis of macaroni but find that taking the analysis of all the wheats we have water 10.5, ash 1.8, protein 11.9, crude fiber 1.8, nitrogen free extract 71.9. This would indicate while macaroni would have the crude fiber removed and is more concentrated, it should make an excellent feed if fed with a chop of hay or some roughage to lighten it in the stomach. It is rather high in protein to make alfalfa hay a good balance for it, but it should go well with the first cutting that has a mixture of other grass. Or it should do well with wheat or barley straw. If the calves are thin, this should not fatten them and if a little more fat is needed, add to the ration corn in some form. The actual way the cattle will act on this feed will have to be worked out by experiment. I will be glad for further report of the matter after a trial has been made.—M. E. S.

Mistletoe on Walnuts.

I have softshell walnuts that have growth of mistletoe on some of the branches. Will it kill the trees? It has already caused large knots to grow where it is attached. What is the best way to kill it?—G., Los Angeles.

The best way to correct a trouble like this is to remove it entirely, in fact, we presume that is the only way. We do not know that it would kill the tree, but it would undoubtedly reduce its bearing capacity. If the limb is an important one, we should remove as much of the mistletoe as possible, then watch carefully to keep down. Probably the very best way would be entire removal of limbs affected.

Record Holders.

Being a constant reader of your valuable hints on dairying in the California Cultivator, I am taking the liberty of asking you for the records of two or three of the best cows in the world.—Subscriber, Waukena.

While the list of the greatest producers is constantly changing with cows under tests, the following yearly records are among the highest and indicate the greatest value in their persistence of milk flow. It is hardly likely that the average dairyman will ever be able to approach these records, for the cows are protected from every annoyance and are watched and fed to the exact amount they can best handle. I saw one cow being tested that was in a special screened house and had an electric fan to keep the temperature even.

Colantha, 4th Johanna. Tested by the Wisconsin station. Holstein. One year's test: Milk 27,432 pounds, per cent butter fat 3.64, pounds of butter fat 998.8, equal to 1247.95 pounds of butter.

Yeksa Sunbeam, Guernsey cow. One year's test. Total milk 14,920 pounds, per cent of butter fat 5:74, pounds of butter fat 857.15, equal to 1071.43 pounds of butter.

Jacoba Irene. Jersey. 399 days' test: Milk 17,253, per cent of fat 5.22, pounds, per cent of butter fat 5.74, 1121 pounds of butter.

These three cows are all pure bred registered stock. They are called the half ton a year butter cows. If butter sells for an average of 25 cents during the year the butter returns alone will come up to $250.

A few tests of common cows handled with skill are also on record. The best of these is the common animal that was of no breed whatever, Molly W., with 8252.3 of milk in one year, per cent of fat 5.99, pounds of fat 466, equal to 882.85 pounds of butter.—M. E. S.

Squash Bugs.

What will drive away insects which are destroying vegetable garden? They are brown and white striped, also green with black spots, something like lady-bugs. They started in on beans, then went to squash and cucumbers. Are now taking the corn. They ruined my garden last year.—F. J., Woodland.

As near as we can determine from the letter these are the common squash bugs which are very destructive in gardens. Their numbers can be greatly reduced by hand picking, destroying them early in the season. Also pick off the eggs from the leaves. These are deposited in clusters when the vines are very young. Bugs may also be trapped by laying boards loosely over the ground; they will gather under these for protection and may easily be destroyed. However, if they are very thick use gypsum saturated with kerosene and scatter over the ground. This will generally drive them away. As soon as the crop is harvested gather and burn the vines to prevent pests appearing next year. In any case do not charge these pests with being "lady bugs." Lady bugs are always the gardener's helpers.

Aphis.

Rose bushes are covered with green lice. What are they and what will destroy them?—Subscriber.

Spray with tobacco extract made by steeping tobacco stems purchased at any cigar factory, or a preparation of tobacco may be purchased and diluted with water and sprayed over the tender tips on which the pest is doing its work. Kerosene emulsion and several other sprays are also good.

Rough Skinned Oranges.

I have several orange trees that bear rough-skinned fruit. What is the best fertilizer to apply to smooth them up? Trees are seven or eight years old. What is the cause of oranges decaying on the tree?—Subscriber, Glendora.

We do not believe these oranges can be "smoothed up" by any fertilizer. Of course, it is generally believed that a heavy application of stable manure results in strong growth of tree and sometimes thick and rough-skinned oranges, which withholding manure for a time will correct. A liberal application of superphosphate and possibly potash will place the soil in better condition and result in better condition of fruit, but we would judge from this letter that the roughness of fruit comes from character of the trees. If that be the case then rebudding is the only salvation. If the affected trees are surrounded by others giving fair-skinned fruit and the treatment has been identical, then we would rebud at once,

2% A MONTH ON YOUR INVESTMENT!

There are investments that pay dividends as high as 2% a month.

The opportunities for investing in these companies, where there is practically no risk, are rare and come to but very few.

I am presenting an Importing Co.'s stock that I confidently believe will pay better than 2% a month within a year and will continue to grow larger as business expands. You will believe it also if you will investigate.

In this offering I am giving you a rare opportunity to become interested in one of the best money making enterprises on the market today.

The company has a small but sufficient capitalization. The company's capital is always intact or in orders which are convertible in cash in a short time; hence, the safest kind of an asset. No perishable stock of goods to be destroyed or to depreciate in value.

There is a small block of this stock to be sold at a figure that will make money for its purchasers.

I have been handling investments and stocks for years, but never have had a proposition before which has had such extreme merit, where absolutely no objections can be found in any way, nor have I ever presented an investment before in which I have such absolute faith.

This is all based upon actual results obtained in the past and not upon "what it should do." If you are interested, I will give you full details which will convince you.

if uncertainty exists observe the trees closely for a couple of years, then rebud if necessary.

Without further information we could not say definitely what is the cause of oranges decaying on the tree. It is possible that decayed oranges were dumped in the orchards last year for fertilizer and the mould spores have covered the ground and are attacking the fruit on the trees. This has been the case with lemons and was the occasion for investigations by the Department of Agriculture. We would be glad to hear more particulars as to this decay.

Oranges on Alkali.

Would you consider it advisable to set out orange trees where there is alkali? The alkali runs in spots over about ten acres. I believe it could be ditched and washed out, but I want to know whether it would be safe to plant while the alkali is there.—Subscriber, Sanger.

We do not think it would be advisable to plant oranges in soil which is subject to alkali. In the first place, it is an indication of an impervious subsoil, otherwise the alkali would have leached from these surface spots. The orange takes especially kindly to well-drained sub-soil. We have seen oranges budded on sour stock roots in slightly alkaline land, but they certainly will not stand any great amount. The best way is to have percentage of alkali in soil determined by analysis. It is possible that tiling this land would remove the alkali and put ground in good condition for oranges.

Irrigating Trees in Bloom.

Does it harm prune trees to irrigate during blossoming period? — Subscriber, Reedley.

We would prefer that heavy irrigation should precede blossoming period by a few weeks. The chilling of the ground which is inevitable, especially at this season when irrigating water is cold, checks the flow of sap to a certain extent. In case of weather conditions being adverse the combination might result in a shy crop. After the fruit is well set then heavy irrigation may be given.

Sulphuring Grapes.

Sometime since I saw query regarding sulphuring grapes immediately after blooming. Would you advise sulphuring early on a large scale? If so, how about rainy weather? How many times should sulphuring be done through the season? My vines are seven years old and bloom profusely but by picking time there are but few grapes left on the larger vines. The leaves die in the centers and the grapes burn.—Subscriber, Reedley.

Sulphur the vines at once, again when the blossoms are on them and again about three weeks later if the weather is not too hot. Apply the sulphur early in the morning up to nine o'clock while the vines are moist from the morning dampness. After the thermometer reaches 100 it is not safe to use sulphur for fear of burning. The sulphur should be of a velvety texture and of the bulkiest package for the weight obtainable. A knapsack sulphur machine will apply it more economically than the use of hand bellows or sacking. Are you sure your last season's trouble was not hoppers rather than mildew? Last season these little chaps played havoc with the vines all around the valley. The excessive drying out of the berries last year occurred owing to the long spring drought and was bad on all classes of grapes.—M. E. S.

Fumigation vs. Spraying.

What per cent is fumigation better than spraying with a ten per cent coal oil or a three per cent distillate mixture? Will fumigation kill silver mite? Can you give names of bulletins on fumigation?—Subscriber, San Diego.

It is impossible to give percentage of insects killed by either fumigation or spraying; it depends entirely upon the care of the operator in either case, also upon the particular insect treated. The three per cent distillate has been found to be injurious to orange trees and for that reason, if for no other, fumigation should be used where possible. The worst of the distillate injury to orange trees is that it is not immediately apparent, but in a period of years it has shown serious defects. Spiders and mites are usually effectively treated by the use of sulphur-hydrated lime mixture.

Write to the Bureau of Entomology, Department of Agriculture, Washington, D. C., for Bulletin 79, Fumigation Investigations in California, written by Special Field Agent R. S. Woglum.

Bloat or Hoven.

I have a fine Jersey cow that has been bloating. I was feeding her alfalfa hay and once I gave her three or four heads of Golden Amber cane which was not real dry and she bloated. I gave her soda, ginger and asafoetida, which gave her relief, then I fed her oat and barley hay with a little green alfilaria at times when it was not wet with dew or rain, but she still continues to bloat every few days. Soda and salts relieve her for the time. She does not seem sick, for she is ready to eat any time. I feed her carefully.—Subscriber, Beaumont.

While there may be medicines that are good in these cases, I have found better results in chronic cases of bloating from a change to more readily digested foods to cure them up quickly Make a mixture of 100 pounds of rolled barley, 100 pounds of bran, 50 pounds of oil cake. Add to each feed a tablesponful of common baking soda and a trifle of salt. Feed her at first half a pound morning and evening for two days, then a pound twice a day for several days, then raise to two pounds at a feed. When the bloating stops, change diet again by reducing it a little at a time so as to leave it off entirely. The use of oil cake is excellent in these cases and improves the digestion more quickly than anything else I have ever tried. Because it is good, do not try to feed more than a pound and a half at the most, or it will be too rich for the cow's digestion. There is nothing in the feed she is receiving to cause the trouble, except that it has become a habit that must be broken up. I would feed no other grain while using the barley-oil cake mixture. Give her enough long hay to help her regurgitate, and the alfilaria is always good for her.—M. E. S.

Crop on Overflowed Land.

What is the best crop to plant on land recently overflowed and left with deposit of silt from one to two feet deep? Would you advise millet, timothy or sorghum?—C. E. G., Hynes.

We have never heard of timothy doing well in this section, but do not doubt that either the millet or sorghum would make good feed on these lands. If the silt is fine and water could be supplied, these would be reasonably sure to give good crops. Of course it depends on the character of the deposit. If deposited by a strong current and only coarse sand is left the crop would be extremely poor, if anything at all. This is a question which only study of local conditions could answer.

Diseased Tomato Vines.

Can you give me information as to enclosed tomato vine? What is the disease and remedy?—Subscriber, Pacific Beach.

This was referred to Prof. Ralph E. Smith of the Southern California Pathological Laboratory and he writes: "The tomato plant which your subscriber enclosed is affected with the nematode worm root-gall. This trouble is caused by a microscopic worm which infests the roots and causes them to swell into little knots or galls. The only remedy for this trou-

ble is to change the soil and use none which has had affected plants upon it. Soil usually becomes free from this pest after drying thoroughly for a season."

Paraffining Orange Blossoms.

Can you tell me how to preserve orange blossoms for two or three months? I understand that paraffine wax is used.—W., Lindsay.

We repeat directions sent us by Mrs. F. B. Mitting of Oakland and published in our issue of October 10, 1910:

"Melt the paraffine and keep it quite warm. Use sufficient so that the bunch of blossoms will all be covered. As you hold the stem between the fingers, dip the blossom down quickly in the paraffine, then shake so that no drops will hang to the petals. Cool by blowing on the blossom and shaking a little until the wax seems to have cooled. If it gets too cool it shows on the blossoms. Dip one at a time. I have preserved perfect calla lilies, roses, forget-me-nots and many other flowers in this way."

We may add that while it is well to have paraffine "quite warm" it must not be quite hot. Test will soon determine proper temperature.

Alfalfa Seed Production.

Will you give information as to conditions necessary for alfalfa seed production? How many bushels may one expect, and other factors?—Subscriber, Ventura.

This would require more space than can be given in this department and we have in preparation an article for other pages of the paper which will appear within a short time, giving experiences of growers in different parts of the state.

Evaporator.

Can you tell what style dryer is best for the drying of apricots and apples? A dryer, say, that will hold some 2000 pounds of the green fruit. Also, will you give me some idea as to the construction of same?—Subscriber, San Luis Obispo.

Apricot drying in this state is so generally done in the open sunshine that the construction of evaporators is almost unknown, and while the product of an evaporator is somewhat nicer, the handicap of additional cost would put the producer at a disadvantage with those in the warmer valleys where such a process is not necessary. We ask any of our subscribers of the coast counties who have had experience with this method of handling fruit to give us any information they can on this line. In addition we refer the inquirer to the "Likfresh" system on page 423 of last week's Cultivator. We have seen some of the fruits processed by this system and it is indeed wonderful. Particulars may be had by addressing Wann Co., 514 Union Savings Bank Bldg., Oakland. Help may be had by writing U. S. Dept. of Agriculture, Washington D. C., and asking for Farmers Bulletin 291 "Evaporation of Apples."

Stock for Peach and Apricot.

What difference does it make in the growth of an apricot if it is budded on a peach or an apricot seedling? It is generally believed in this valley that the apricot roots are not as subject to root knot as the peach. Would not an apricot on apricot root be more likely to become affected by the green disease?

Would like to know if an apricot on peach root will live as long as one on apricot root.—W., Hemet.

Mr. George C. Roeding of the Fancher Creek Nurseries answers as follows:

It makes practically no difference as far as the growth of the tree is concerned whether an apricot is budded on a peach or apricot seedling. In some sections, particularly in Santa Clara county, where the crown root borer does considerable injury, the apricot and Myrobolan roots are used almost exclusively for apricot trees for the reason that this pest does not attack either of these roots. As to root knot, no accurate statement can be made because in my experience I found in some cases on the same ground apricot seedlings were as much subject to knot as peaches. Generally speaking, however, I do not think the apricot root is as subject to root knot as the peach. As to the longevity of the tree, I would consider the peach root under most conditions better than the apricot for over a period of years. The apricot root is far more subject to gum diseases and also to sour sap, when there are sudden changes in the temperature, than the peach.

Remedy for Snake Bite.

In response to inquiry from a subscriber at Plano for best method of treating snake bite in horses, Mr. T. Phillips of Alhambra sends the following: "Put on plenty of Venetian turpentine about four times a day. But keep your knife in your pocket, cut nothing, not even hair, but wipe the wound clean before each application."

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Splints.

A colt seven months old has small lumps the size of a bird's egg, one on the inside of each front leg about one inch below the knee. I am told these are splints. What will remove them?—Subscriber, Riverside.

Paint the parts with tincture of iodine three days in succession, skip ten days and repeat. Under this treatment the splints should disappear from a colt of the age mentioned, in six or eight weeks.—F. G. M.

Sores and Lameness.

A mare has sore places on the under surface of the body, exuding a watery fluid, blood and matter. The places itch at times. What will heal them? When standing, one forefoot and then the other is extended ahead as if something is wrong with the feet. Sometimes when coming from work she breaks out in a sweat. Why is this?—Subscriber, El Modena.

Use zinc oxide, the powder or ointment, every night. Observe if the heels of the shoes injure the wounds when the mare lies down, and correct this if necessary. Horses having coffin joint disease "point" or extend first one foot on the other and are disposed to perspire from moderate work, the perspiration appearing first at the base of the ears and in the flanks, but free general sweating may result after a day's work. When chronic the disease is incurable. Allow the mare to go without shoes as long as possible, then apply a shoe with a high heel.

--The Largest, and Lowest-Priced Furniture House in Western America

Our immense store—150,000 square feet of floor space—and our immense reserve warehouse—the largest in the West—contain the largest stock of household and office furnishings carried in any establishment west of the Mississippi River. Furniture, pianos, carpets, Oriental and domestic rugs, wall papers, draperies, linens, mattresses, bedding, stoves, water heaters, table and kitchenware, etc. Largest assortments in all lines; lowest prices on all grades of goods; best terms for all classes of buyers.

We pack goods carefully and ship promptly to any point.
It will pay to buy of us if you live anywhere west of the Rocky mountains

Write to us, if you cannot visit our store in person. Our Mail Order Department will furnish prices on anything you may need in our line, with pictures or photos of furniture if necessary.

THE AVERY FARM TRACTOR AND CITY TRUCK

For the farm—for the road—for the mine. Does the work of six to twelve horses—hauling—plowing—harrowing—renovating alfalfa—driving pump, hay baler, thrasher, other machinery.

BAILIE & BRANDT CO., 943 N. Main St., Los Angeles, Cal.

DWARF MILO MAIZE
A DRY LAND CROP

Where the rainfall is limited or water is expensive there is no more profitable forage and dry feed crop than **Milo Maize.** It belongs to the sorghum family of tropical Asia and Africa, where it is the principal grain grown.

We have secured a stock of a dwarf variety that has been thoroughly tested in Southern California and Arizona, yielding two and one half tons of grain per acre. It grows a stalk 4 to 5 feet high with large, compact, erect heads, and stock especially like the sweet flavor of the stalk.

"Let There be Light."

—PAT HENRY, before the battle of Bull Run.

We are not sure that our old friend Pat has been correctly quoted, neither do we know that he was anywhere near Bull Run during that memorial event, but we do know that every Rancher, Miner, Dairyman, Stableman and Teamster on the Pacific Coast should be in possession of at least one of our Vehicle Headlights, here illustrated.

There are times when a good, strong light is almost indispensable. It is needed around the barn, the thrasher, the harvester, on the gang-plow, on your wagon or buggy when driving over rough roads, the ranch, the mine or the dairy.

A Boesch Vehicle Headlight is worth a dozen ordinary hand lanterns. They are well made, strong and durable, each one is fitted with a highly polished silver plated parabolic reflector which concentrates the rays of light with remarkable brilliancy. The body is finished in a rich glossy black with polished brass trimmings, and for appearance it is first in order of handsome lamps. It embodies all our latest improvements, and for efficiency as a light producer it is without equal. This is the Headlight that caused the passing of the State Law prohibiting the hunting of wild ducks by artificial light. It is being used by nearly every Fire Department on the Coast and in many of the large Eastern cities.

Do not be led into buying a cheap, inferior lamp. It won't pay. This one is the result of forty-two years' experience in the business. It is home industry, and we guarantee satisfaction. It is made in 6, 8 and 12-inch sizes, measurements across the face.

We also manufacture many other styles of Headlights, Lamps, Lanterns, etc., too numerous to mention.

Write for Catalogue and full particulars of lamps or lanterns that you require.

Anaheim, Cal.

Timely Ranch Suggestions

WORK OF THE GRANGE.

One of the oldest and best of the organizations used by farmers to advance their own interests is the Order of Patrons of Husbandry, or more generally known as the "Grange." In the issue of March 23 Mr. Keesling, of San Jose, described the work of the Grange in Santa Clara county. He also suggested that the advantage of this organization to Southern California is not appreciated. At our request, Mr. John Tuohy, of Tulare, gives an outline of work in that county. His account is most interesting, and we trust of value to other organizations, because of its suggestions.

Mr. Tuohy Writes:

Tulare county is a Grange county. Including the county or Pomona Grange, it has five Granges, Tulare Grange being the oldest. It is the business of the lecturer every six months to make up a program of subjects for consideration and discussion at each meeting. I herewith send a copy of the program for the present six months. Besides the subjects on our program, other subjects are discussed at our meetings, as they come up.

At each meeting we have a social lunch. The lunch and the sociability it provides are both very enjoyable. We invite you, sir, to join us in our lunch, if you are here at any of our meetings; our reception of you, as it is to each other, shall be one of friendship and respect. Come and see us and lunch with us.

The aim of the order, that on which it was organized forty years ago, is to build up the farming community. We have made slow work of it, but we have learned. We are earnest in our work. We desire to see it known better, but we feel timid about reporting it for publication.

The regular meetings of Tulare Grange are on the first and third Saturdays of each month. Yesterday was our regular meeting day, and after the lunch, which is never omitted, the first and second degrees were conferred on a class of six, three sisters and three brothers. The degree work was exceptionally well done, was appreciated by the candidates, and was a credit to the officers. After conferring degrees, the Grange passed a resolution expressing its gratification at the approval of Constitutional Amendment No. 1, providing for a new system of taxation and the enactment into law of a bill for its equitable enforcement. The State Grange, Patrons of Husbandry, fully appreciates the long-continued, able and patriotic work of Senator John Curtain in the adoption of the amendment and in the preparation and enactment of the law. Tulare Grange expressed its profound gratification to him for it. For the committee on state highway, Brother Thomas Jacob reported that the State Highway Commission is to be increased to seven members. It was claimed that on that commission the Order of Patrons of Husbandry, being both a state and national organization, should have one representative, and Brother Nichols, of Dinuba Grange, was recommended to the Governor and to the County Board of Trade for the place. Brother Nichols has all qualifications to fill the office with credit to himself and profit to the state. We shall always think the order is entitled to a representative on the Highway Commission, and that Brother Nichols should be the representative.

The first subject considered was, "How can the local Grange promote co-operation?" This is one of the most essential objects for which the Grange was organized. Perhaps the best object lesson in Grange co-operation in California is that of Soquel Grange. This Grange has made definite arrangements with the Rochdale store at that place to get certain articles at prices covering the cost of handling only to the Rochdale. Other articles are purchased at the regular rates charged by the store. Now, the result is that the Grange is the best sustained of any subordinate one in the state, and the Rochdale store is one of the few successful ones in California. This brings to our view two objects which should never be overlooked by any subordinate Grange. First, it should always provide and work for some material benefits to its members, that they may be interested in and work for the benefit of the order. Next, that co-operation will do it.

The second subject under consideration was, "Why do farm products increase in price 100 per cent or more between the farmer and the consumer? What is the remedy?" It was at a late hour of the meeting when this subject was brought up. It was not clearly shown that there is such an increase of cost or what is the remedy for it. It was argeed the subject should get further consideration, and if the farmer, for his products, does not get price enough to fully compensate him for labor and investment, equal to that accruing to other industries, then what is the remedy?

At times the consideration of many subjects is spirited, but at all times a considerate allowance is made for each others' personal feelings, under the masterful rulings of the lecturer; perhaps, too, the excellent lunch provided by the sisters—on that they need no lecture on co-operation—has much to do in promoting respect for each other.—John Tuohy, Tulare.

Program.

The program of the Tulare Grange for the coming three months is:

April 15. Is it wiser for a farmer to carry his own fire insurance than to pay the rates of the incorporated stock insurance companies?—John Tuohy.

Is it right that we patronize mail order houses?—Charles Carpenter.

Suggestions for labor-saving contrivances and conveniences for the farm and home.

May 6. Which has the better chance for success, the rich or the poor man's son?—Mrs. Flora Sayre.

My summer vacation.—Mrs. Ella Stiles.

May 20. Is it profitable for the Grange to hold open meetings?—R. F. Guerin.

May 28 being the anniversary of our organization, let us make it a birthday party.—Mrs. Lizzie Woods.

Question box.

June 3. How can the State Grange promote the industrial interests of the farmer?—J. T. Lawson.

Why is it that farmers do not take greater interest in the conservation of the natural resources of the country?—C. A. Henry.

June 17. Should the farmer fix the

selling price of his products? If so, how can he do it?—George Watts.

Roll call. My object in joining the Grange.

In addition, there is music and the luncheon at each session.

FORMALIN TREATMENT PREVENTS SMUT.

Were your oats attacked by smut last year? Are you using those oats for seed? If so, tne formalin seed treatment should be applied to such oats before sowing, even if only a small amount of smut was present, in order to prevent the disease in this year's crop.

Oat smut causes an enormous annual loss, the country over, and Indiana's share is much too great. It should, and can be, prevented.

Cause and Nature of the Disease.

Oat smut is a disease caused by a microscopical organism, a fungus, which entirely destroys the heads of the affected plants. This fungus lives and grows within the tissues of the affected oat plants, entirely invisible from without until the diseased plants begin to head out. The smut fungus then enters the young "would be" kernels and destroys both them and the accompanying chaff, and masses of worthless black, powdery material are produced instead. These powdery masses consist of innumerable, minute spores (corresponding to seeds) of the smut fungus. These smut spores are blown about by the wind to sound kernels of the healthy oat plants near by, and remain on them, ready to take advantage of the situation when such oats are used for seed. When such oats are sown, the attached smut spores germinate under the same conditions and at the same time that the oat kernels do, and the fungus, by its very minute, tubelike growth, penetrates into the tissues of the very young oat plant. Here the fungus thrives, drawing its nourishment from its host, and grows up within the oat plant through the season. When the latter heads out, the heads are entirely destroyed. The kernels and chaff are largely, if not entirely, changed to black, powdery masses, the spores of the fungus. These spores are thus ready to be blown about to sound oat kernels and carry the disease to the next year's crop.

The Remedy.

It is clear, then, that the point of attack is in the seed. If the seed oats can be so treated as to kill the smut fungus spores clinging to them, and yet not injure the growing quality of the oats themselves, then such a treatment is successful, and should be applied to seed oats wherever there is danger from smut. Both in specially conducted experiments and in ordinary farm practice, the formalin seed treatment has been repeatedly found to fulfil both of these requirements admirably. It not only has the merit of being highly efficient, but it is safe, inexpensive, and easy of application. The treatment is as follows:

Formalin Seed Treatment.

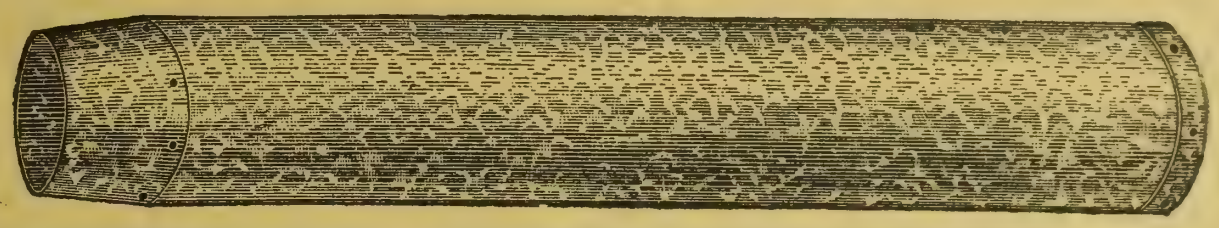
After the seed oats are well cleaned with a fanning mill, spread them out on a clean floor or canvas, or in a tight wagon box. While shoveling them over, sprinkle them, until thoroughly moistened, with the following solution, which may be mixed in a barrel and applied with a sprinkling can: One pound (about one pint) of formalin (40 per cent formaldehyde, procurable at drug stores) thoroughly mixed with fifty gallons of water. Continue to shovel the oats until all kernels are evenly moist, then cover the pile with clean grain bags or canvas and leave covered at least two hours. The formaldehye gas, thus confined and evenly distributed through the pile, kills the smut spores, but does not injure the oats. After the two hours, uncover and spread out the oats to dry, stirring occasionally with a garden rake, or otherwise. When sufficiently dry, the oats are ready to sow. If they are to be kept for some time before sowing, they should, of course, be more thoroughly dried, to prevent heating. Ordinarily it is most convenient to treat the oats the afternoon or evening before they are to be sown. Then in the morning they are ready.

Each gallon of the made up solution is enough for a little more than a bushel of oats; that is, one pound of formalin mixed with fifty gallons of water is enough for fifty or sixty bushels. The price of formalin (40 per cent formaldehyde) varies from 25 to 40 cents per pound. It should be practically as clear as water.

After treating the seed oats, avoid contamination with smut spores from untreated oats, as in bags, bins, etc. Clean bags and bins should be used, or they may be cleaned by washing with boiling water or the formalin solution.

Two or three men can easily treat fifty bushels in less than half an hour, that is, to the point of covering the pile. The treatment should be generally practiced where there is any danger from oat smut.—A. G. Johnson, Assistant Botanist, Indiana University Ag. Ex. Sta.

SAVE YOUR TIME WATER and GRADING
BY IRRIGATING WITH AMERICAN
SURFACE IRRIGATION PIPE



The **PIPE RECOMMENDED BY ALL USERS.** It is the **ONLY SCIENTIFICALLY CONSTRUCTED SURFACE IRRIGATION PIPE** on the market. **THERE'S NO ROUND SEAMS TO LEAK,** retard the flow of water or weaken the pipe. This pipe is easily handled and cheaper than flumes. It will last a life-time. For irrigating alfalfa it is the only pipe to use. We make **RIVETED PIPE AND TANKS.** Write for Illustrated Catalogue, also **SPECIAL IRRIGATION FOLDER** which may mean much to you.

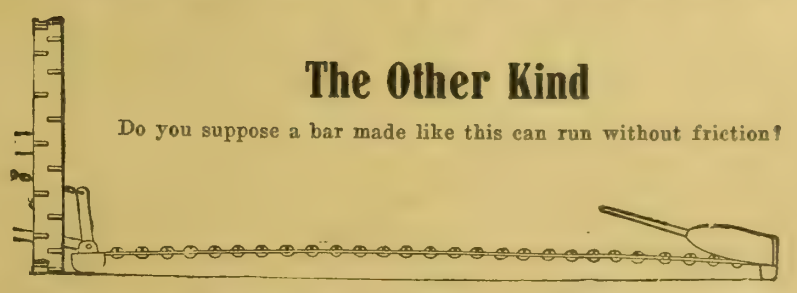
ADAMS PIPE WORKS, 2025 Bay St., F 1917 Broadway 1274 **Los Angeles, Cal**

The New Standard Mower

The New Standard Cutter Bar

It is the Lightest Draft, Because the Compensating Lever and Suspension Spring enable the use of the curved cutter bar(straight when lowered), which forms a frictionless channel for the knife. In this construction the Bar floats over the ground, instead of being pulled or pushed as in all other mowers. Heavy Draft and Side Draft are avoided.



The Other Kind

Do you suppose a bar made like this can run without friction?

It is the Most Powerful Cutter, Because the entire weight of the Cutter Bar, when cutting, is transferred through the Compensating Lever and Suspension Spring to the main drive wheels, thus securing additional traction when most needed.

IT IS MADE TO CUT—ALWAYS AND EASILY

Your request will bring full information promptly.

R. D. No. 6, Santa Ana, Cal.,
February 13th, 1911.

The California Cultivator,
115 No. Broadway, Los Angeles, Cal.

Gentlemen: It may be of interest to you to know that the small liner which I recently inserted for one issue in your paper (as per clipping above attached) has brought to me returns to the amount of $386.50. More than one-half of this came to me from the central and northern part of the State. I have been compelled to return to correspondents $48.00 because of the impossibility of filling some of their orders at the exact time desired. You can see from the above that this has been a profitable advertising proposition for me.

Very truly yours,
W. D. ROSE.

And sold stock and eggs to the the amount of $386.50

NURSERY STOCK.

Blue Andalusian and Buff Orpington —from best strains. $2.00 per 15. choice Buff Minorca eggs. Mrs. A. V. Box 302, San Luis Obispo, Cal.

FARM LANDS FOR SALE.

Owens Valley offers to the farmer unusual opportunities for diversified farming. With the elevation of 4,000 feet, no fogs, abundance of mountain water running by gravity, a disintegrated granite soil, having been washed from the mountains for centuries, a growing condition is created, the results of which are almost unbelievable.

Alfalfa, as high as four tons to the cutting; timothy with 10-inch heads; from 350 to 500 bushels of potatoes to the acre; as fine Spitzenberg and Winesap apples as grow in Washington and Oregon; a hog, cattle and poultry country that we believe is superior to anything in the State, and, on top of this, the most delightful climate and wonderful scenery.

Surely any afrmer figuring on making a change should at least investigate Owens Valley before deciding. Buying a farm is buying a home, and it may be that you will spend the rest of your days on the next farm you buy. Certainly it is worth very serious thought. We want to mail you booklets and pictures, which will tell you a complete story of Owens Valley. The James R. H. Wagner Co., 329 S. Hill St., Los Angeles. Room 10.

For Sale—50 to 200 acres, $27.00 per acre, irrigated land; 1-3 cash, balance easy terms. My ranch of two hundred acres can be had on above terms. I will guarantee your expenses in writing if you go and see this property and do not find it to be all level land, good rich soil (free from alkali and hardpan). Water right goes with land and all ditches to the land are complete and paid for. This property is located in the Yaqui Valley, Sonora, Mexico. All adjoining property owned by Americans. Hotels, stores, warehouses run by Americans. Two hours' drive to the ocean. Good markets, two full crops yearly. You can earn over $50 per acre net profit yearly on this land and can grow anything you know how to plant. Address Box "O," Cultivator.

$12,000 Cash—The best located, best improved and equipped fruit ranch for sale in Sonoma Valley. 41½ acres fully bearing trees, principally apples (Gravenstein and Astrachans), Bartlett pears, peaches and prunes. Packing and dipping houses with cement floors. Tool, chicken houses, and granary. 8-room house for help, large barn, 7-room dwelling, lighted by electricity and furnished completely. Laundry and bath, hot and cold water. All vehicles and implements, one gasoline spray and pump outfit (new), cow, team. Inspection solicited. For further description and particulars write owner, W. S. Ross, R. D. 1, Box 26, Sonoma, Cal.

For Sale—A fine 20-acre money-making alfalfa ranch, sandy loam, with plenty of water for irrigation. 3½ miles east of Bakersfield, 1 mile south of Kern, 1½ miles from good school, on good oiled road. Mail daily. Fine 8-room house, large barn, new hay shed with track and fork, capacity 50 tons; outbuildings. Chicken house, 150 White Leghorn chickens. Good well water, piped conveniently. All farming implements. 2 extra fine young mares, No. 1 colt, 2 good milk cows, some household furniture. 14 stands bees. Also 20 acres of fine wheat. Price $6500, $3800 cash, balance 4 years, 7 per cent. No trades. Wm. Mantz, Maricopa, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale or Trade—230 acres Oregon land in the famous "Rogue River Valley;" fine fruit land, 40 acres cleared, balance in timber; located ten miles from Central Point. A good two-story farm house, large barn. Fenced with 17-wire "Page Fence." Schoolhouse on corner. Would exchange for Los Angeles country or city property, to value of $8,000 or $10,000. Address Z. H. Grace, Central Point, Ore., P. O. Box 203.

20 Acres, adjoining the Roeding and Wood Nursery land, 1½ miles S.E. of Exeter; best of soil, good location; fine for oranges or lemons. Pumping water at shallow depth, road on both sides, high school. Price $175 per acre, $2000 cash, balance 2 and 3 years, interest 7 per cent net. Fred M. Hart, Exeter, Cal.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

For Sale—Orange land in small tracts in Exeter district. Large tract of level, fenced, pasture land. Plenty water. Part cash, terms. Apply Fred M. Hart, Exeter, Cal.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 481, Lancaster, Cal.

Tulare County Alfalfa Land—8000 acres in any size tracts, artesian water. Opening sale from $30 to $60. Easy terms. To the first man who will immediately improve will allow him his own time to pay for his land. Thomson & Rupp, 322 West 6th St., Los Angeles.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—Fine alfalfa ranch, ½ mile from R.R. station, 86 acres, abundance of water. Only $300 per acre. $10,000 cash will handle this. Would consider a trade for good income property in Los Angeles. John W. Shepardson, 215 Katz Bldg., San Bernardino, Cal.

For Sale—Two small farms, or both as one. Plentiful water supply. Good house and barn on one. Part in alfalfa. Ideal for poultry raising. Address owners for particulars. Leonard Coates Nursery Company, Morganhill, Cal.

Agricultural Implements—Vehicles.

WICK'S FOWL WHITE FARM, Moorpark, Cal

A Boon to Cabbage Growers—A New and Sure Remedy for the destructive Green Cabbage Worms, which will save the loss of millions of dollars, will be sent Free to all who send 10 cents for a trial package of New "Early Snowball" Cabbage, the finest early variety yet. Tillinghast, the Seedsman, Scranton, Pa.

LITTLE WILLIE AGAIN.

"Pa!" came little Willie's voice from the darkness of the nursery.

Pa gave a bad imitation of a snore. He was tired and did not wish to be disturbed.

"Pa!" came the little voice again.

"What is it, Willie?" replied his father, sleepily.

"Tum in here; I want to ast you sumpin'," said the little voice.

So pa rose up from his downy and, putting on his bathrobe and slippers, marched into the nursery.

"Well, what is it now?" he asked.

"Say, pa," said little Willie, "if you was to feed the cow on soap would she give shaving-cream?"—Harper's Weekly.

HOW ABOUT IT?

Griggs—I am a great believer in the magic number seven. "Success" has just seven letters, you will notice.

Briggs—And how about "failure"?—Boston Transcript.

Children should be trained to eat slowly and masticate their food thoroughly. This necessitates cultivating the habit of being prompt in rising in the morning, so the breakfast need not be hurried. Many a mother thinks she is doing a kindness to her child to let him sleep in the morning. She does not realize what a bad habit she is helping him to form, one that will prove a hindrance all through life. If the child goes to bed at the proper time he will get the required amount of sleep and can rise promptly without the slightest harm.

Many children do not care for vegetables, yet they should be encouraged to eat them. Vegetables supply valuable minerals which aid in purifying the blood; they also furnish bulk to the food, which causes a healthy exercise of the muscles in the digestive organs. By presenting a variety and preparing each vegetable in a number of ways, the child may be led to cultivate a taste for this class of foods.

A child who is fussy about his eating meets many unpleasant situations later in life and often places his hostess in an awkward position, because he has not cultivated a liking for good, wholesome foods in general.

General Household Notes

EASTER.

By Margherita Arlina Hamm.

The lilies whisper to the bees;
The palm leaves murmur to the breeze
And birds in roundelay
Repeat the message high in air,
Until it echoes everywhere,
"The Savior rose today."

Full well the swaying blossom knows
How loving spring dispels the snows;
And songsters half behold
A truer life within the breast,
When newer life invades the nest
And mingles with the old.

It may be that a hidden sense
Reveals to their intelligence
The presence and the sway
Of Him who notes the sparrow's fall,
So that in gratitude they call,
The Savior rose today.

Who, looking over time's long scroll
Cannot but see a master soul
Behind the dross and clay,
And realize that in the good
Which brought the world beatitude
"The Savior rose today."

The earth brings forth both bud and flower
By some unfailing subtle power
Which baffles all decay;
When into being sprang the word,
The flowering of mankind occurred,
The Savior rose that day.

From ugliness new beauty springs;
From death life soars aloft on wings;
And evil dies away.
A splendor dissipates the gloom
And fear lies dead within the tomb,
The Savior rose today.

THE ORIGIN OF EASTER EGGS.

By E. A. Matthews.

Germany is the home of the Easter egg. Other lands, of course, have them, but nowhere are they so beautiful or so freely bestowed, or used in so many lively games. On Easter morning in Germany there is always great excitement over the colored eggs and sugar eggs, and painted eggs and eggs with presents inside found in the nests the children have prepared, and every little one you meet will be saying, "Oh, just see what the dear little Easter Hare has brought me!" No one seems to be quite sure where this idea started. Some say it came from the old days of heathen-worship. But I have heard a wise German scholar tell this story, and he says that it is believed by most thoughtful people among the Germans:

Many hundred years ago there lived a good and noble woman whose name was Frau Rosalinda von Lindenburg. In those days a cruel war was laying waste the land, and she had to fly from her home in the dead of night, with her two children. At first she knew not where to go, but her old serving-man begged her to go with him to his own people, who lived in a little mining village hidden away in the Harz mountains. So the noble Countess put herself in his care, and his brothers and sisters were very kind to the poor wanderers, took them in and gave them the best they had. But the best they had was very poor, and, at first, the daintily-reared woman and children came near starving. There was no meat, no fish, and not even an egg; and this last for the good reason that there was not a single fowl in the settlement. These domestic fowls that seem so common to us, and that we see everywhere, at first came from the far East, and had at that time only been seen in large cities and towns. And these mountain folks had never even heard of such "strange birds."

So the Countess decided to repay their kindness. She secretly sent her servant down to their old home. There he found the castle almost wholly destroyed, but was lucky enough to gather up a large number of the chickens that still roosted about their old home. He brought them up to the mountains and great was the surprise of all the peasants as they saw the queer birds. But a few weeks afterwards they were still more astonished and delighted, for a young brood of chicks was shown to them by the kind Countess. O, how the village children laughed and clapped their hands at the sight of the little, downy, bright-eyed creatures, who were so strong and spry, and who followed the old hen about to pick up their food on the very day they came out of their shells. Such a contrast to the blind, bald, ugly little fledglings that they saw in the nests in the hedges.

Now the Countess saved up her eggs until she had enough for a feast, when she invited all the housewives to come and taste the new food, and learn how to prepare it. At the close of the feast she gave each family a number of fowls to take home and use for the family. When Easter came, she was anxious to do something for the children, and it occurred to her that as the egg was the sign of new life it would be a nice thing to have an egg festival for the children's Easter treat. So she took mosses and roots, and with them colored some of the eggs—saying that "the earth lays aside her mantle of snow in the spring, and God himself made the fruit and berries not only good to eat, but pleasant to look upon."

On Easter Sunday, after the villagers had met for their simple service, she called all the little ones, and after talking pleasantly to them for awhile, she led them into a grove near by. There she told them to play about, and pretend they were little birdies, and make themselves some cute little nests. Then she called them to her house, or cottage, and gave them a little feast of the best she could prepare. It was only some nice milk-soup, with cooked eggs, and egg-cakes. When they had finished their feast, they heard a great whispering and cooing, and squeaking in the grove where they had left their nests. What could be the matter? The children ran back to see, and lo! in every nest there were five beautiful colored eggs, and on one of these, a little rhyme was painted. Imagine the surprise and delight of these simple children. They talked among themselves, and wondered where they came from. "What a strange hen it must be to lay eggs of so many colors!" said one. "O, I do not think that hens lay such hard eggs," said another. But a third one said, "I am sure it was that dear little hare I saw jumping out from behind the bushes where I made my nest." This idea seemed to please the little ones, and they all shouted together—"Yes, yes—the little hare laid the colored eggs." And they kept on repeating it until they began to believe it.

Not long afterward, as the Countess sat talking to the children, who was it that the little daughter saw coming up the mountain? It was the dear father, the husband whom they all thought must be dead. And as he

came to them on this Easter day, it was another reason why the Countess loved the day and wished to have it always celebrated. So when she went back with her husband and children to rebuild their old home, she left a sum of money to be expended in giving the children an Easter egg-feast every year. She also started the fashion of the "egg-feast" in her own Duchy, and so it grew, and by degrees the custom spread all over the land, and the eggs also at length became a sort of a symbol of restoration to happiness and redemption from sin. The custom has spread to our own country, but I think none but German children believe that the eggs are laid by the timid little hare.—Exchange.

EASTER MONDAY.

Since Easter day always comes on Sunday, the day following has been termed Easter Monday, and its special mission seems to be to allow the children a chance for rolling their Easter eggs.

On Easter Monday the gates to the beautiful yard of the white house are thrown open and the children of Washington are allowed to roll their colored eggs. Hundreds of children take advantage of this privilege and spend the day romping and playing games on the private lawn of the president and his family. Not only the children enjoy this day, but a great many grown people go also, so the large yard is well filled all day. The lawn is especially suited for egg rolling as it slopes down from all sides. The eggs go tumbling and rolling down the grassy slopes and as they strike against each other many are broken. Sometimes a wee urchin brings with him a turkey egg and takes pride in seeing how many of the smaller eggs he can break. The president usually spends a part of the day watching the children enjoying the sports of their annual holiday.

HOT TAMALES.

Here are two chicken tamale recipes taken from the American Weekly. Will some of the Cultivator subscribers send in beef and Texas tamale recipes.

Cook a good-sized chicken in salted water and when tender chop the meat fine. Peel and seed a dozen red peppers, soften in warm water, then chop fine with a clove of garlic. Fry a small onion in a little lard and when brown add a tablespoon of flour, then add peppers. Cook for five minutes and add chicken with some finely chopped olives; a few raisins may be added if liked. Season the mixture with pepper, salt and a little sugar; meanwhile prepare a paste by mixing yellow cornmeal with some of the liquor left when the chicken was boiled. Add a little butter or lard, season with salt and knead well. When the chicken mixture is well cooked take the necessary number of good corn husks that have been softened in warm water and spread them, first with the corn meal and then with the chicken. Roll the husks so that the cornmeal will be on the outside; turn the ends and tie with twine; steam three-quarters of an hour and serve in husks.

Another.

Boil a chicken until tender; remove bones and chop meat fine; to each pound of meat add one medium-sized tomato and onion, chopped fine, salt and red pepper to taste, and moisten to the consistency of mush with chicken broth. Heat the remainder of the liquor to boiling, stir in cornmeal to make a little stiffer than ordinary mush and cook thoroughly. Soak fresh corn husks in warm water until soft, then spread a half-inch layer of mush on each husk; put a good spoonful of the meat mixture on that and roll up so that the meat is covered by the mush and the whole is nicely wrapped in the husk. Turn in the ends, tie tightly with twine and steam half an hour. Serve in the husks.

CRULLERS.

A good recipe for plain crullers: One tablespoonful of melted butter, two heaping tablespoonfuls sugar, one egg, yolk and white beaten separately; ½ saltspoonful cinnamon or mace, ½ saltspoonful salt; flour enough to roll out. Roll, cut into strips, and twist up; fry in boiling fat.

Crullers are especially good if fried in olive oil, the oil being used in making them instead of butter. To ½ cup of sugar add two tablespoonfuls of oil, two beaten eggs, ½ teaspoonful of salt, ¼ teaspoonful of cinnamon and a little nutmeg; add two cups of flour sifted with two teaspoonfuls of baking powder, alternately with ¼ cup of milk. Roll out, cut and fry as usual. In frying them let the oil get just hot enough to smoke.

Crullers, Chocolate—Two eggs beaten until they are creamy and then beaten into one cupful sugar, adding one tablespoonful melted butter, ½ teaspoonful each of salt and cinnamon, one square grated chocolate. Mix well and then add one cupful sweet milk, three cupfuls of flour sifted with two teaspoonfuls baking powder. Roll out ¼ inch thick, cut, cook to a golden brown in smoking hot fat. Roll in powdered sugar when cool.—Rural New Yorker.

A REMINDER IN BLACK AND WHITE.

Upon going into the kitchen one morning I saw a newspaper lying on the floor in front of the oven. Starting to pick it up, my maid said, "That is to remind me that I have something in the oven." This idea has proven very helpful to me, especially when I am baking and have other duties to attend to.—Woman's Home Companion.

THE DANGEROUS GARMENT.

Mrs. Jasper—"Mrs. Turnley has given her hobble skirt away; she was afraid to have it around."

Mrs. Davis—"Why?"

Mrs. Jasper—"It nearly strangled her cook the other day."

Mrs. Davis—"How?"

Mrs. Jasper—"The ignorant girl tried it on upside down, and the small part got 'round her neck."—Woman's Home Companion.

SO ABSURD.

Youth—Look here! This horse I hired from you runs on to the pavement every time he sees a motorcar.

Horse Dealer—Well, you don't expect a horse to run up a telegraph pole or climb a tree, do you?—New York Journal.

WASTED.

We refuse sympathy and intimacy with people as if we waited for some better sympathy and intimacy to come. But whence and where? To-morrow will be like today. Life wastes itself while we are preparing to live.—Emerson.

The superiority of some men is purely local. They are great because their associates are little.—Johnson.

Pioneer Roofing

—best by every test

The Popularity of **Pioneer Roofing** is due to its **wearing** qualities. We want to go on record right here and now with the positive assertion that a "Pioneer Roof" will outlast **two** ordinary roofs. The first cost is little if any more than you would have to pay for roofing of inferior quality. And once a "Pioneer Roof" is on, there is no further cost. It requires no paint or repairs.

Pioneer Roofing is made in several weights; suitable for residences, hotels, outhouses, business blocks; anywhere that a sunproof, rainproof roof is required. Comes in handy rolls. Easy to lay. No special tools needed. Everything necessary will be found in the center of each roll, for which there is no extra charge.

Free Booklet and Samples

The mauufacturers of Pioneer Roofing have published a 32-page booklet, which is effectively illustrated. The booklet is both interesting and instructive. It tells how to lay roofing—and what weight or thickness of roofing is best suited to the various kinds of buildings. The booklet and samples of roofing will be mailed free upon request.

Pioneer Paper Co.

247-251 South Los Angeles street
Los Angeles, California.

If your dealer does not carry Pioneer Roofing—notify us, and we will see that you are supplied. Address Dept. 11.

Paint Is Cheaper Than New Buildings

You know how quickly a building that never saw paint goes to rack and ruin.

The boards rot around the nails, they crack and warp.

Only constant repair keeps the building standing.

An occasional coat of good paint made with

"Dutch Boy Painter"
White Lead

and real linseed oil will save your buildings and reduce repair, to say nothing of improving the looks of the place.

Decide to use "Dutch Boy Painter" White Lead this spring. It's a mighty good investment.

Write for our "Helps No. 1326 which will tell you why, how, with what and when to paint.

ARE YOU GETTING ANYWHERE?

You are rushing after riches, with a grim look on your face;
You are spurred by one ambition, in your breast peace has not place;
You have turned away from others whom you clung to long ago,
You have ceased to find contentment in the nooks you used to know;
You are straining, you are striving, through the dark days and the fair,
But, oh, restless, eager brother, are you getting anywhere?

In your haste you have forgotten how to linger or to smile
When a child looks up and greets you or would claim your care awhile;
Though the wild rose sheds its petals in the lonely pasture still,
And glad breezes sway the blossoms in the orchard on the hill,
You are too much in a hurry, too much occupied to care,
But, with all your eager efforts, are you getting anywhere?

You have turned away from pleasure, trouble haunts you in your dreams;
It is long since you have lingered on the shores of shaded streams
That go singing to the pebbles they have made so clean and white
And have polished at their leisure and their pleasure day and night;
You have ceased to know the solace that is in a sweet old air,
But with all your greedy grasping, are you getting anywhere?

You have given up old fancies; you have left old friends behind;
You are getting rich in pocket, but you're poor in heart and mind;
You have lost the sense of beauty in your haste to get ahead,
And along the ways you travel, grief and bitterness are spread;
You no longer care how others bend beneath the woes they bear,
But with all your cruel crowding, are you getting anywhere?

Out beyond you there is darkness that no morning's light shall break;
In the distance there is silence that no song shall ever wake;
At the journey's end dishonor waits for them that day by day
Cheat their souls and starve their senses while they hurry on the way;
You are passing many pleasures that you have the right to share,
As you rush to fill the hollow men will dig for you somewhere.

—S. E. Kiser—in Record Herald.

Making a life is a larger thing than making a living. Many a man has made a good living who has made a poor life. Some men have made splendid lives who have made very moderate or even scanty livings. Such was Goldsmith's village preacher, who was "passing rich on forty pounds a year." Such was the citizen of Germany, and of the world, who earned hardly three hundred dollars in any single year of his journey here; yet few men have ever had more out of life than Martin Luther. It behooves us, therefore, to consider how we may add to our making of a living the making of a life. So to make a living as to make also the capability of enjoying a living, of using a living after we have made it; so to make a living as also to make a character, a faith, a hope, a soul—this is to add to the making of our living the making of a life.—Anon.

NO RISE.

They say that living sterner grows,
From high to higher varies;
They speak of food and roof and clothes
As costly necessaries.
But still no rise in smiles I see,
In friendship and forgiving,
In love and jest and charity,
Which make up truly living.
—Woman's Home Companion.

I would not enter on my list of friends
(Though graced with polished manners and fine sense,
Yet wanting sensibility) the man
Who needlessly sets foot upon a worm.
—Cowper.

He who is not actively kind is cruel.
—Ruskin.

Hay.

Scott, Magner and Miller say:

Arrivals of hay for the past week were 2,427 tons, quite a decrease from last week of 3,970 tons. It would have been impossible for the market to have taken care of receipts as large as last week, as even with the smaller receipts the market has shown a trace of weakness, whereas last week there was quite a firmness to note in good qualities, and they moved off with little difficulty. The majority of the hay for the past week has been of an exceptionally good quality.

From our information there has been very little activity in the country, and few lots have changed hands. We have had a most seasonable rain in the last few days, which has extended practically all over the state, and has been of inestimable value to the growing crops. Export trade has also been very light during the week, and very few orders have been placed here for immediate shipment.

Alfalfa has been in light supply as well as demand.

We quote the wholesale prices in round lots on today's market, as follows:

Fancy wheat	13.00@13.50
No. 1 wheat or wh and oat	10.00@11.00
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.00@11.00
Other tame oat	7.50@9.50
Wild oat	7.00@9.00
Stock hay	5.00@6.50
Alfalfa, ton	9.00@10.50
Straw	40@50

Grain.

Barley, fancy	1.48¾
Barley, good to choice	1.45@1.47½
Barley, poor to fair	1.40@1.42½
Oats, white	1.50@1.60
Rye, new crop	1.35@1.42½
Alfalfa seed	18@20
Mustard, brown	4½
Flaxseed	5@5½
Broom corn seed, ton	23.50

Feed Stuff.

Alfalfa meal	17.00
Bran, ton	25.00@26.50
Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Rolled barley, ton	30.00@31.50
Rolled oats, ton	27.50@29.00
Middlings	33.50@36.00
Oil cake, ton	40.00@41.50
Cocoanut cake, ton	25.00@26.00
Mixed feed, ton	25.00@27.00
Shorts	25.00@26.00

Citrus Fruit Market

LOS ANGELES, April 12, 1911.

The weather has forced a slightly reduced shipment of oranges, which, with the high grade of the fruit going forward, has induced a strong condition of the market, and fancy fruit is commanding $2.60, and occasionally as high as $2.75. Shipments are now running an average of 180 cars daily. This will doubtless be increased to close to 200, and at that rate Navels, Mikes and Seedlings will all be cleaned up before the first of June. This will leave a clear field for Valencias, of which there is an exceptionally large crop. Some Navels are showing a little indication to drop, and some are puffing, but this is not serious enough to make any special pressure to unload.

Lemons are behaving beautifully, and even increasing in quotations. With the close approach of warm weather it is a safe prediction that these conditions will obtain until the higher prices of early summer.

Shipments.

Shipments of oranges to date since November 1, 1910, 19,484 cars, lemons 2,299, total 21,783. To same date last season, oranges, 12,729, lemons 1,901, total 14,630.

LOS ANGELES, Friday, April 7.—Five cars sold here at auction today.

WHERE CAN YOU BUY

Irrigated Land

FOR

$27 an Acre?

In

The Great Yaqui Valley

The rush to Mexico is on. The American farmer is beginning to realize that the only CHEAP land—that is, GOOD LAND—left on the American continent today is in MEXICO. It's the LAST CHANCE. And the American farmer is taking advantage of it.

We have less than 5000 ACRES of this land at this price and it is going fast. Get it NOW while you can.

Land level as a floor—splendid irrigation system now in operation—railroad transportation—15,000 acres now under cultivation and American farmers behind the plows wheat, barley, oats, corn, cotton and all other staples.

Buy NOW—later you'll pay more.

Portable Automatic Derrick

WHAT IS IT?

The greatest time and money saver on a farm. It is so handy you can use it for anything you want to hoist.

Last season Mr. H. C. Porter of Alpaugh, Calif., saw our ad in the California Cultivator and, after securing descriptive circulars and prices, he ordered one of our Medium Derricks. The following letter indicates that he is well pleased with the Derrick:

ALPAUGH, CALIF., Feb. 18th, 1911.
SCHMEISER MANUFACTURING CO., Davis, Calif.

GENTLEMEN:—Please send circulars describing your Portable Automatic Derrick to the following:

H. H. Cathcart — Jacob Sonke — J. A. Callister
A. D. Overman — A. B. Ward — F. N. Beason
Ernest Shields

—All of Alpaugh.

Some of them have used my Derrick and all have seen it work and think it is alright. They have alfalfa and need one. I am more than pleased with my Derrick and, with labor scarce and high priced, it is a great saving.. If you wish, I will act as your agent here and try to sell some Derricks.

Yours respectfully,
H. C. PORTER.

We want your name and address if you are a grower of alfalfa or any other kind of hay, so that we may send you circulars describing our Portable Automatic Derrick, a money-maker for you.

Rambler Motor Cars

Rambler
Sixty-three

CHOOSE a car as you would select a thoroughbred—for its pedigree. You will never be content with a cheap automobile, no more than you would be satisfied with a low-bred herd. You may have confidence in the Rambler because of the reputation of this company and the forty years of experience behind it. Big wheels and tires and long wheel base make it the easiest riding car on the road. Seven-eighths elliptic springs and shock absorbers soften the impact of jolts and limit reaction. The upholstering is that of the finest club furniture. No tire trouble with the Spare Wheel. Brakes being larger than necessary, provide a feeling of security. Safety starting device to protect you from injury while cranking. Offset crank shaft and straight line drive enable you to glide along slowly and quietly behind a loaded wagon and take the hills and deep sand without rushing. These features are essential in a car for use on country roads. Experience will prove that they are not mere talking points.

The new catalog is ready—send for it. Ask also for the Farm Owner's Number of the Rambler Magazine. A postal, giving your name and address, will bring these books free.

Vol. XXXVI. No. 16. LOS ANGELES: THURSDAY, APRIL 20, 1911 One Dollar the Year

King Cotton Extending His Domain in California

Shipments of the Finest Grade of Cotton Made From the Imperial Valley to the Mills at Oakland and Exports Made to Japan. The Industry is Rapidly Increasing.

Experiments in cotton culture made for some years in the Imperial Valley created but little general interest. We believe as a rule the venture was looked at skeptically, not that the fear prevailed that nature would not enter into the contract, but that the situation would be complicated by the labor factor. However, two crops have been marketed from the Imperial Valley, the last one aggregating 5,779 bales. For the preceding year it was only 400 bales, but that gave impetus to the next season's planting, so that the acreage increased vastly and the one little gin at El Centro was increased to five, located at El Centro, Imperial, Holtville, Calexico and Brawley. Regarding the planting of last season the Calexico Chronicle says in its annual issue in December:

"There were about 15,000 acres planted this season. Most of it was put in by people having no experience in this branch of agriculture, and consequently there were many who did not obtain the best results. Some fields were not properly prepared, others were planted too deep, and on some, irrigating water was not properly applied. There were about 10,000 acres which had reasonably proper care. Some fields which received proper care, cultivation and irrigation will yield a bale and a half to the acre. It is evident that if a few people, by careful work, can produce a large yield, others can also if they will profit by the example of their successful neighbors. The returns this year will be sufficient to act as an incentive to ranchers to put in a large crop next year. From preparations now being made by growers it is estimated that not less than 50,000 acres will be planted next season.

"Experiments have been made with various kinds of seed. All that has been raised commercially has been short staple upland cotton, most of it being of the varieties known as Sim's Improved and Mebane Triumph. Several growers are experimenting with Egyptian cotton. Enough has been raised to show that it can be made commercially profitable, but up to date our rich soil and abundant water have produced very large stalks, sometimes reaching to a height of eight or nine feet, without a corresponding amount of fruit. This no doubt can be remedied by a proper selection of seed and with less frequent irrigations. This cotton, having a much longer length of staple, sells for about thirty cents a pound on the market when ordinary short staple brings only about half that.

"No trouble was experienced in obtaining help for the production of the crop, but the picking season arrived with a scarcity of the proper kind of help. At the time of this writing this need has been met to a great degree, and the remainder of the crop will be harvested without trouble. As we have no frost until about Christmas, cotton will continue to make growth until that time, and our picking season will probably last through January.

"An average sample of the cotton grown here was submitted to the New Orleans Cotton Exchange Board of Classers, who report as follows: 'The cotton is of fine style and as good as the Texas cotton. It has good body, strong staple, measuring one and one-sixteenth to one and one-eighth inch. The sample grades good middling. In fact, such description of cotton will always find a ready sale at full prices in our market.' Much of the cotton which has been carefully picked will grade higher than this sample. With the absence of rain and dews, and the driving storms which stain and dirty the cotton, the product is uniformly of very good color.

"This crop is being marketed on this coast, the Oakland Cotton Mills taking a portion and Japanese buyers the remainder. As the freight rate to a port is less than from Texas points, Japanese mills find it to their advantage to give us the benefit of the difference and get the excellent quality of cotton grown here.

"The cost of raising a crop here must depend, as anywhere else, on the care exercised in planting and cultivating it. But a total expense of $35 per acre should prepare the ground, pay for the seed, planting, water for irrigation, cultivating, picking and ginning, where the work is all done by hired help. With a yield of one bale to the acre, from $60 to $70 can be realized for the lint, and $7.50 for the seed, which makes an attractive proposition."

The production of the various sections was: El Centro, 2,093 bales; Brawley, 1,077; Holtville, 929; Calex-

CITRUS Trees

Buy and Plant Citrus Trees NOW

We have a magnificent stock of the best varieties still on hand and are prepared to fill orders for almost any quantity from our extensive nurseries either at Whittier or Exeter.

ORANGES

As a revenue producer, where conditions are favorable for its development, one year after another, we know of no more profitable variety than

THE VALENCIA LATE

On account of its coming on the market in the late spring and early summer months and the further fact of its being an acid fruit, makes it sell nicely in connection with deciduous fruits.
VALENCIA LATE ORANGES have sold at higher prices than any other oranges and in favorable localities where there is no danger of the fruit getting frozen, the Valencia is sure to be a money winner on account of its increasing strong demand. It is a vigorous grower and prolific bearer. Actual returns from producing orchards show more net profit per acre than from any other orange grown. We have a fine stock of 2-year-old trees and can fill your orders for these trees as well as the WASHINGTON NAVEL in almost any quantity.

LEMONS

EUREKA, LISBON, VILLA FRANCA

POMELOS

MARSH'S SEEDLESS, TRIUMPH

Our trees are all grown under ideal soil and climatic conditions, insuring sturdy, well matured stock with excellent roots.

Magnolia Nursery Whittier, California

Citrus and Tropical Fruits

CITRUS BY-PRODUCTS.

By Alexander Craig, Folsom.

In his address reported in recent Cultivator, Mr. Harold G. Powell said with much truth that future success in the citrus industry will depend to a large extent on the creation of by-products. The wonder is that we have been able to get along as well as we have hitherto without any attention to them. The beef trust makes fertilizers, the oil trust makes aniline dyes, the steel trust turns its slag into Portland cement; every great industry makes its profits largely out of by-products, and why should the citrus industry be an exception to the general rule?

Year by year we are increasing the orange crop by thousands of carloads and calmly expecting the good American people to have stomach for them all. This year they tell us that over forty thousand carloads of navel oranges will be shipped out of the state and that means over twenty oranges for every man, woman and child in the United States. When you consider that millions of the people are too poor to buy oranges and millions of infants too young to eat them, you will have to reckon thirty or forty oranges for every available month.

It would be all the better for the people to eat an average of thirty or forty oranges per annum but the question is, will they pay a reasonable price for any such quantity?

The diminishing returns would indicate that they will not do so. In this section the net price received this year has been only about a cent and a quarter a pound—half of what we have to pay for very inferior potatoes. Isn't that enough to break the fruit growers' heart? Well now, suppose we were to market only the extra fancy fruit and turn all the rest into orange cider, marmalade, orange juice, alcohol, flavoring extracts, or whatever else can be proved profitable. As long ago as 1893 an excellent article of orange cider was made in California, and sold on the fair grounds of the Columbian Exposition at Chicago. It was a fine beverage and appeared to be in good demand. It would seem as if a little judicious advertising might have made it popular all over the world. For generations a firm in Dundee, Scotland, has been making orange marmalade and selling it everywhere. No oranges grow within a thousand miles of Dundee, and there is little doubt that better marmalade can be made from the sweet navel orange than from the bitter seedlings of Spain. The big hotels in New York are serving glasses of orange juice to their guests in place of the fruit itself. Why cannot we put up the juice in bottles and sterilize it so that it will bear transportation?

In these days of wireless telegraphy and airships we cannot believe that anything is impossible, and there is no question but that good, saleable by-products of the orange can be made and marketed in almost unlimited quantities. It would take some money for experimenting, and some more for advertising, and it would be rather a formidable undertaking for any individual, but the Fruit Growers' Exchange could do it with their fine organization and excellent methods of working. They saved us from destruction once—will they not do it again?

PREVENTING DECAY.

From a circular to packing house managers, issued by the Citrus Protective League, we quote the summary, for in it are many points of interest to orchardists:

The following suggestions are offered to the packing house managers. Their hearty co-operation is asked in putting these suggestions into practice. It is a business question and affects the interest of every fruit grower vitally:

Do not allow decayed oranges to accumulate under the brusher, the bins or hoppers, or around any part of the machinery, or in any part of the house. Sweep the house clean every day, wash the machinery frequently, and destroy every orange that is not fit to ship.

Do not allow decayed oranges or lemons to enter the washing machine, the brusher, or any part of the machinery. This happens frequently in many houses, and one decayed orange passing through the machine affects it and spreads the disease.

Do not brush the fruit if it is already clean. The brush is a most effective way of spreading disease. The bristles carry the spores into the mechanical injuries of the fruit.

Do not wash the fruit unless it is smutty. Segregate the clean fruit, and wash only that which actually requires it. There is no more effective method of spreading blue mold than the washing machine, especially the old tank type of washer. The water furnishes ideal conditions for the growth of the disease. This is especially true of navel oranges. The water accumulates and is held in the folds of the navel.

Do not try to disinfect the water for blue mold. This disease cannot be killed by any strength of copper sulphate or permanganate of potash that would not be injurious to the fruit.

Do not place boxes of decayed fruit on the windward side of the house, or have the cull pile near the house. Clouds of spores are carried in with every gust of wind. They settle on the machinery, on the fruit, in the bins and boxes, and increase the chances of infection.

Do not handle decayed fruit with gloves, and afterward handle the sound fruit with the same gloves. No surer method of infection could be adopted.

Do not keep the decayed fruit in boxes that are afterward to be used in the grove. Provide special boxes, mark them, and use them for nothing else.

Do not allow the hucksters to sort over cull fruit that contains decayed oranges or lemons, unless the cull pile is removed some distance from the house. The spores rise in innumerable numbers in handling the rotten fruit.

Do not fail to wash the picking boxes, if decay starts while the fruit is in them. This applies also to lemon trays. It is a wise precaution to line the bottom of lemon trays with paper. It reduces the injury to the fruit, and makes it easier to keep the trays clean.

Do not fail to line the rot boxes with paper in such a way that the papers may be folded over the boxes when full. This will prevent the

spread of an enormous number of spores.

Do not allow the graders to throw decayed fruit in the rot boxes. Have it placed in them carefully. The spores from a single rotten orange or lemon thrown in a rot box spread throughout the house.

In cleaning lemons which have been next to decayed fruit, use a damp sponge, to prevent the spores from flying through the house. Clean the sponge frequently.

Do not let up on the campaign for careful handling. It was never needed more than in the present year.

These suggestions are made to supplement the careful handling of the fruit, and not to take the place of it. They apply to the citrus industry some of the simple fundamental precautions that are in every-day use in preventing the spread of human diseases.

Do not forget that the cleanliness and neatness of the packing house is an infallible indication of the care with which all the fruit-handling operations are carried out.

FLORIDA ORANGE DECAY.

California is not alone in its problem of orange decay. Experts of the Bureau of Plant Industry are working in Florida and proving helpful and the problems are practically the same in both cases. We therefore quote from a short address made by Mr. A. V. Stubenrauch before a mass meeting held in the city of Tampa recently. We say "mass" meeting though there were only twelve orange growers present. We sometimes think California fruit growers are slow, but we recall the Pomona meeting of citrus growers when from 700 to 800 filled the hall at each of the two-days sessions and appreciate the fact that California growers are more insistent for the latest information which concerns their business.

Mr. Stubenrauch said in part, as reported by the Florida Grower:

We attacked the problems in the field or grove and packing house by studying, first of all; by getting data in the grove on picking and handling. We have one man who has devoted practically his entire time to studying conditions in the work that is being done by various gangs of pickers and had one man—or rather two men studying the cleaning of the fruit—cleaning, washing and preparing the fruit for shipment. Still others have taken over the shipping problems; have prepared fruit for shipment; have taken fruit which has been very carefully handled from the time of leaving the tree until it went into the car along side of fruit which had been commercially picked and carefully handled and packed; another lot which had been commercially handled throughout. These were shipped through to Washington where we have had men busily engaged all the winter inspecting these various lots and obtaining the actual percentage of decay in the experimental boxes which have been shipped.

You see, therefore, that there is no guess work, and no estimating about it. The results cover wide grounds, approaching practical commercial conditions. At first sight it seems easy to prevent injury to fruit, but we will bring out in the course of this discussion that it goes back to handling and to the methods of carrying on the business of preparing the fruit for handling.

The general principle regarding blue mold getting into punctures, which causes most of the decay, was worked out in California on an exceedingly large scale. There was no guesswork. It was worked out in a way that allowed of no doubt. Lots of oranges were taken just as they were brought in from the grove. They were gone over very carefully and only the sound ones were placed together, and all those which were injured in any way were placed in another lot. Then we took decayed oranges, covered with spores and we blew the spores over the fruit in each box; put the different boxes away for two weeks, holding them in lemon sweat rooms where the temperature was kept to between 80 and 90 degrees, with water evaporating, giving just the conditions of warmth and moisture for decay. Some 300 experiments were made, and the work showed that where you had a perfectly sound orange with blue mold spores over it, there was only a little over one per cent decay, while the average of all the injured fruit was something like 25 per cent; proof positive of the general principle demonstrated in a large way.

The question was then asked: "What kind of clippers do the best work?" Mr. Stubenrauch answered it by stating that the clipper did not matter as much as the man behind it. Good work was done with all kinds of clippers, and poor work with some good clippers. He went so far as to state that good work was done with poor clippers. He had seen four and five per cent of clipper cuts with an instrument that was supposed not to be able to make cuts. The clippers must be kept sharp and taut at the joint; if they are dull, or if they wobble, they will give a ragged edge to the stem, which will then injure other oranges. Every scratch and every puncture, remember, is a chance for blue mold.

The charts show that some houses in Florida are doing good work; they get their fruit to market in sound condition, with only a very small per centage of decay. The matter of handling has got to be placed on a profit and loss basis. We have examples both here and in California showing what a good investment careful handling is. You can work out the extra profit on the fruit carefully handled, but you can't estimate in dollars and cents the value of a reputation in the market. I don't think I am putting this too strongly.

VARIATION IN BUDS.

By Carroll B. Smith.

A great deal of attention is being given by orange growers these days to bud selection and some interesting results have already been observed.

I have in citrus nursery some one year old and some two-year old buds. These trees will average smaller than those of same age in most other nurseries, I have observed. The buds were selected from outside fruit spurs of mature, heavily bearing trees, and I have been told by several nursery men and others that such buds will make very prolific trees, but not rapid growers. These gentlemen say also that buds chosen from "fat" suckers or "water sprouts" usually found inside the tree, will make large "fat" trees but not so prolific.

A few rows of the nursery referred to above contain trees from buds from large "fat" suckers and their size and general vigor are much more marked.

If any of your readers have had any experience with this subject I am sure many of us would be glad to hear from them through your columns. The "outside fruit spur" bud wood mentioned will have a diameter of about ⅜inch and short, whereas the large fat sucker wood will have double that diameter and larger.

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Our finely illustrated booklet, "Citrus Fruits," covering the industry from the seed to the market, mailed to any address on receipt of 25c in stamps.

Deciduous Bush-Tree Fruits

APRICOT OUTPUT.

It is altogether too early to make any definite predictions of the apricot output for the coming season. But as there were many fears expressed that the shyness of bloom would result in an extremely light crop, requests were sent to several apricot producing sections for report of the early outlook. It is definitely known that the crop will ripen much later (at least two weeks) than did last year's, which was one of the earliest ever.

The interest in marketing operations is increasing every day and we note that Ventura county is now organizing a marketing association. The Orange county association has met and discussed plans and has decided on one change which will be made from last year's program; the association itself will handle the crop instead of leaving the fruit in the growers' hands and then marketing at a minimum price, or as much more as the grower could secure. The association has not announced any minimum price for this year; it will merely go into the market and secure the best possible returns. This is a wise change, for last years' plan left the association people holding the sack while outsiders shaved the association price by the merest fraction and unloaded. If in addition to Ventura and Orange counties other sections will form these marketing organizations, the industry of the whole state will be benefited. On the day producers refuse to sell unless the price is entirely satisfactory they will not only begin to make money themselves, but will give a boost to markets all along the line. Orange county's output last year was about 1000 tons of cured fruit and the average price to association members was ten cents. It is estimated that the formation of the association resulted in a saving to members of more than $40,000.

From estimates of this season's crop formed in various sections we quote:

J. G. Berneike, Santa Ana, Orange Co.

Our apricot trees bloomed out very late, and drying will begin later than usual. Judging from orchards in my immediate neighborhood the outlook at the present time is for a good crop, at least normal, and much heavier than last year. It will be two to four weeks before we will feel quite sure of what we shall have. We are assured by this time that the price will be good.

J. A. Wilson, Secy. Chamber of Commerce, Santa Ana, Orange Co.

From indications today the apricot crop will be 30 per cent greater than last year.

L. O. Yount, Redlands, San Bernardino county.

It is a little early to estimate closely but I think the crop of apricots is about the same as last season, which was 750 tons green. The 1909 crop was about 1100 tons. This includes all Redlands district.

D. C. Funk, Upland, San Bernardino county.

The crop along the foothills north of Cucamonga where my own orchard is located is heavy and it will be necessary to thin. Farther down in the valley the crop gets lighter especially south of Cucamonga, and south and east of Ontario it is almost nothing. There are only a few apricot orchards along the foothills and the average as a whole would only be a small per cent of last year's crop.

Wm. B. Jackson, Ontario, San Bernardino county.

From the present outlook for the South Cucamonga district, we will have a fair crop this year; trees have as much on as they will carry and make fair-sized fruit, and much larger crop than last year.

Hemet Canning Company, Hemet, Riverside county.

The indication for apricots on the Hemet tract is about normal, or the same as last year. Peaches better than last year; plums good; pears rather light. The frosts of last week did no damage on the Hemet tract as far as we can learn.

A Two-Year-Old Imperial Valley Vineyard.

John Dent, Ventura, Ventura county.

There was a good deal more blossom this year than last, but the rain and damp weather have done considerable damage. In my own orchard for example, there were three different blooms. The first bloom set well and fruit is now the size of cherries; the second all rotted when about the size of a pea; the third bloom was damaged, but cannot say yet to what extent.

C. Thorpe, Santa Paula, Ventura Co.

Conditions generally seem to be about as favorable as they were last year. Perhaps in the large valleys in this county the crop will be somewhat lighter than last season, but I find that in the higher altitudes there are about as many apricots on the trees as can be brought to maturity. Last week in a small section around Moorpark, black frost damaged the crop to a slight extent, but present indications are for a yield of about fifteen or sixteen hundred tons for Ventura county.

John W. McKay, Saticoy, Ventura Co.

Orchards about Saticoy will run all the way from a quarter to a full crop. Royals are showing up well; what Moorparks there are are very shy. There have been planted this season in Wheeler Canyon some 2500 apricot trees; on my place I have added about 700, mostly Tiltons.

THE COMING ALMOND CROP.

Mr. T. C. Tucker, sales manager of the California Almond Growers Exchange, gives the following condition of the almond market and its promise, also estimates of the coming crop:

"The Exchange since the first of the year has been marketing almonds direct through brokers in the East instead of the Edmund Peycke Company of Los Angeles, and we have now arrangements under way with brokers in some fifty markets of the United States, who are representing us this season. We found it unsatisfactory to endeavor to do business through a third party.

"We might say for your information the Exchange held its annual meeting April 14, and the old directors and officers were re-elected to serve the following year.

"The manager's report was very enthusiastically received, as the showing made by the Exchange the first year is remarkable. We were able to do business along broad lines at a very reasonable expense. We have not lost any members or tonnage so far, and this fact alone is worthy of comment. We have obtained additional tonnage

COTTON

Will be one of the most profitable crops in the

GREAT YAQUI VALLEY

where you can now buy

IRRIGATED LAND

for

$27 an Acre

(Easy terms).

Experimental planting of COTTON, last year, in the YAQUI VALLEY, yielded as high as 2½ BALES TO THE ACRE.

Thousands of acres are being prepared now for this year's Cotton crop.

REMEMBER, that labor is an important factor in growing Cotton, and native labor in the YAQUI VALLEY costs 50c (gold) a day.

ALFALFA

Is also a great success in the YAQUI VALLEY, yielding as high as 10 TONS TO THE ACRE in a season. ALFALFA is now worth $15 PER TON in the YAQUI VALLEY.

YOU CAN'T AFFORD

to locate anywhere until you investigate the

Great Yaqui Valley

Send or call for printed matter.

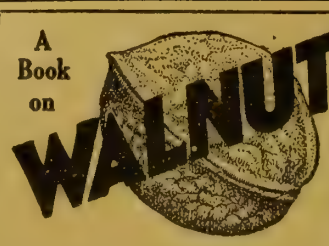
A Book on WALNUTS And How to Grow Them



The only book ever written devoted exclusively to the walnut. Gives instructions for planting and propagating compiled from results of twenty years experience in walnut growing. The grafting process as depicted with photographs is applicable to all trees. Prepaid, $1.00.

JOS. M. ANDERSON, 416 J Street
Sacramento, California

for the coming year by the reason of new members joining hands with us, and where we had 40 per cent of the crop last year we will probably have 50 per cent or more this season. The outlook for the California Almond Growers Exchange as a co-operative organization is very flattering, and the associations affiliated with us are well pleased with the results. We have already received a great many orders; in fact, we are declining orders for certain varieties at this time.

Very careful estimates of the crop indicate the crop of the state to be about one-half of what is was last year. Ne Plus and IXL will be extremely short, Nonpareil about two-thirds of last year, and the soft-shell varieties will be a fair crop.

VINEGAR MAKING.

It is only within comparatively recent years that the true nature of the biological processes involved in vinegar making have been fully understood. Pure cider vinegar, as it is produced on the farm, has been taken as the standard of excellence for a long time, but as one buys this article on the open market, he seldom finds it possessing the merits claimed for it. There seems to be little excuse for the existence of so poor an article, for with a little care and a few simple directions the average farmer can produce as high-grade vinegar as the most fastidious could desire.

In the first place, avoid the use of old vinegar barrels, unless they are thoroughly scalded with either boiling water or live steam. The object of this is to destroy objectionable germs which are apt to be present, and which might produce bad flavors if allowed to develop in the fresh cider. If practical, pasteurize the sweet cider by heating it for twenty minutes at 155 degrees before placing it in the clean barrels. This precaution is taken in order to rid the cider of undesirable yeasts and bacteria. The barrels should not be more than two-thirds to three-fourths filled with apple juice, and the outer air allowed free access to the cask through an open bunghole stoppered with a cotton plug.

The alcoholic fermentation is started best by adding a cake of either compressed or dry yeast. By this means a good quality of alcohol is produced, and the hard cider which develops is reasonably free from the numerous off flavors which are so commonly present in vinegar made in the old-fashioned way.

When the cider has reached the "hard cider" stage, which, under ordinary farm mangement, requires from five to six months, if the barrels are kept in a temperature of 45 to 55 degrees F., add to each cask a small piece of "mother of vinegar" which previous experiment has shown to possess desirable vinegar-making properties. The hard cider should now be kept in a warmer place, 65 to 75 degrees, to allow the more rapid growth of the acetic acid germ, the chief constituent of the "mother," which changes the alcohol of the hard cider into acetic acid. At this temperature the acetic acid fermentation may be completed in fifteen to eighteen months, or, if left at the lower temperature, in twenty-one to twenty-four months. When the maximum amount of acetic acid has been produced, the clear vinegar should be drawn off and stored in clean, well-scalded barrels, which should be completely filled and tightly stoppered; otherwise deterioration may take place, due to the action of certain germs which destroy the acetic acid in the presence of an abundant supply of oxygen.

Pasteurization has been suggested as another means of preventing the deterioration, and, if carried on properly, is to be preferred to the method above described. This consists in heating the vinegar for twenty minutes at 120 degrees F. By this means the harmful bacteria are destroyed, without the loss of either the acid itself or the volatile substances which give cider vinegar its characteristic flavor.—Walter G. Sackett, in American Cultivator.

THE SUPPLY OF POTASH.

Potash is used in the arts for many purposes, but by far the largest use is for fertilizing the land.

While we were engaged in robbing the soil there was no special demand for fertilizers in this country, and what there was was easily supplied while we were in the process of removing the forests in the hardwood sections of the country, with such supplies from imports or small mineral deposits as were available.

In recent years the demand for this essential fertilizing element has rapidly increased. Deep borings in Germany and Austria revealed the existence of enormous beds, apparently as nearly inexhaustible as any mineral deposit can be.

The potash from these mines can be delivered in the markets of the world so much cheaper than potash from any other source that it has been considered that Germany had virtually a monopoly. Like all other important German industries, the potash output is controlled by a trust, in which the German government participates, and which limits output and regulates prices. The country is familiar with the difficulties growing out of a contract secured by an American syndicate, while the German trust was temporarily disorganized, and which the German government is rendering nugatory by an export tax.

This trouble with Germany is naturally increasing interest in endeavors to discover potash deposits in this country which will make us independent of Germany. It is highly improbable that any limited district has a monopoly of profitably working deposits of a mineral so generally diffused in nature. The great German deposits lie very deep in the earth and were discovered by borings made for other purposes.

The geological survey announces in a bulletin just issued that conditions are favorable for the discovery of potash deposits in the arid districts of this country, and if congress appropriates the funds thorough exploration will be made.

If such deposits are found, it will be an indication that when sufficiently pressed mankind is likely to find on or in the earth whatever it may need to sustain its increasing population. It has been recently stated that our coal is likely to be conserved by electrical heating, to a great extent, by utilizing falling water now running to waste. The world probably has potash enough, and if Germany is unreasonable we shall dig till we find it.

If the geological survey should find potash deposits, it will be interesting to see whether we shall follow the German method of organizing trusts under government regulation.—San Francisco Chronicle.

Something of a rumpus has been kicked up among prune growers in the northern part of the state because the board of control of the state of Iowa has decided it cannot buy California prunes at 12½ cents a pound. Perhaps if they would send a commission of their board to this state they might be able to purchase a few at a much lower price than that.

DWARF MILO MAIZE
A DRY LAND CROP

Where the rainfall is limited or water is expensive there is no more profitable forage and dry feed crop than **Milo Maize.** It belongs to the sorghum family of tropical Asia and Africa, where it is the principal grain grown.

We have secured a stock of a dwarf variety that has been thoroughly tested in Southern California and Arizona, yielding two and one half tons of grain per acre. It grows a stalk 4 to 5 feet high with large, compact, erect heads, and stock especially like the sweet flavor of the stalk.

Garden and Field Crops

PEANUTS.

By R. H. Forbes and R. L. Crane, Arizona Experiment Station.

While peanuts are not as yet an important crop in Arizona, many inquiries concerning them necessitate the writing of a timely hint on the subject.

Soil: Peanuts, like most subterranean crops, thrive best in light, sandy soils; and, being leguminous in character contribute materially to their own fertilization. At the Yuma garden we have therefore secured fair yields without special effort to manure the crop. Arid region soils are always rich in lime, a circumstance also favorable to peanut culture in the Southwest.

Season: Peanuts require a long summer growing season, this fact limiting their profitable culture to more southerly latitudes. At Yuma (Arizona) they should be planted in March or April when danger of frost is over, and will then mature in September, five or six months after planting.

Planting and care: In gardens the shelled peanuts are planted at intervals of about twenty inches in rows three feet apart. The ground should be ridged under the rows only just enough to confine a small irrigating stream between, the soil being gradually thrown towards the rows as the plants develop. About six weeks after planting, the vines will begin to bloom, and the fertilized seeds, in the form of pegs, will shoot vigorously towards the ground in order to bury themselves in the soil and complete their development. The pegs, especially on erect varieties, often have difficulty in reaching the ground. It is therefore necessary, after an abundance of bloom has developed, three to four months after planting, to cover and weight down the vines with earth from the furrows, which may be applied in a small field with a shovel. This will enable the nuts to develop until, two months later, they are ready for harvest.

Irrigation and cultivation: In this hot, dry climate especial care must be taken, after the crop is set and the growing nuts are buried in the soil, to keep them well irrigated. A shortage of water in midsummer in the case of some varieties, will result in a crop of empty shells; and in all cases the yield will be greatly lessened. During warm weather about three irrigations a month have been found sufficient in the light, sandy soil of the Yuma garden.

Cultivation after each irrigation will keep the nuts out of the irrigating furrows, and should throw the soil gradually towards the vines, thus affording pegging ground for the crop. An object in ridging the rows at this time is to have the nuts well above water level so that they will not be discolored by being wetted when irrigated.

When the space between rows is covered with vines, cultivation may cease as even bermuda grass can not then secure a foothold.

Insect pests: As thus far observed, peanuts have not been seriously affected by insect pests. Nematodes do not injure them; and insect depredations or plant diseases have not yet occurred upon our crops.

Varieties: With reference to habit of growth, there are erect varieties, such as Spanish and Indian Runner; and the more prostrate sorts, such as Virginia Red. The former require more labor to cover with earth for pegging; while the latter are more troublesome in the irrigating furrows. The Spanish is an abundant yielder, but the nuts are very small. Jumbo and Steckler's Mammoth are showy sorts, but are uselessly large. With sufficient irrigating water the Virginia Red has done well under our conditions, but fails to fill if water is short in summer. Indian Runner, on the contrary, has matured a small crop of well filled nuts with a deficiency of water in August.

Harvesting: When the leaves turn yellow in early autumn the crop should be promptly harvested, as the nuts will sprout and spoil if they should become wet in the ground. Horse diggers are available for large crops; but garden rows may be lifted with a spading fork, and the vines cured and piled where there is no danger of wet or frost. The crop may then be picked from the vines by hand or by machinery, as its size may warrant. Spanish, Indian Runner and Virginia Red have all yielded in small tests (at Yuma) at the rate of from 3,000 to 3,600 pounds per acre, or from 120 to 145 bushels.

Uses of the crop: Peanuts are, for the most part, roasted and used as human food. They are also employed in confectionery, especially the small Spanish variety, and are roasted and salted like almonds. They may also be made into a dry but rich and oily paste or butter. In the Old World great quantities of oil are made from them, which is often used as a substitute for more costly olive oil. The cured vines make excellent hay, relished by horses, cattle and pigs; and, with reference to nitrogen, this leguminous plant is beneficial to the soils in which it is grown.

INVESTIGATING AS TO BENEFICIAL PARASITES.

We note in the monthly report of Prof. C. W. Beers, horticultural commissioner of Santa Barbara county, the following reference to a representative of the department of agriculture now in the state:

Mr. P. H. Timberlake, who has been engaged on the Gipsy Moth work of the department of agriculture, for a number of years, has been sent to our state to make a thorough study of the life history of the friendly parasites that are in our midst. He came to Santa Barbara and sought material along his special line.

Dr. Howard suggested his establishing himself in a section where such material is abundant, and it is very likely that he may spend the summer in this country. This will be of great value to this department, as it will bring to our office door expert entomological discoveries at first hand, and will disclose to us those different parasites of whose real nature so little is known at present. We hope, through this work, to secure some better solution of the problem of propagating such parasites as are most helpful and thus more perfectly protect our orchards against pests.

San Joaquin county will make extensive experiments in rice culture this season.

Home Grounds Beautiful

LOVE OF THE SOIL.

By Chas. D. Merrill.

Take this train for Chatillon, a village two miles south of the fortifications. We have a card to a market gardener there from a firm in the city—he will show us his vegetable garden. He has four acres enclosed by a stone wall seven feet high, as are nearly all these thousand little farms of the suburbs of Paris. At this moment the obliging proprietor, keen, clear-eyed, blue-bloused and with wooden sabots over his leather shoes, is transplanting lettuce, and three women of his family are assisting. It is the middle of December. From beneath the square glass frames where the lettuce was sown and started, the tiny plants an inch high are transplanted to another bed, and there, three being grouped within a circle of fifteen inches diameter, a bell glass is placed over them and under it they grow into clean crisp heads that sell all winter at a fancy price. From this garden go every day in winter great crates of lettuce to Berlin, London, Cologne and other cities where it sells at enough to bring the grower from seven to ten francs for each bell glass of his garden. No heat is used in all this process of intensive culture except that of the sun and the fermenting manures mixed with the soil. So skillful are these gardeners that by the proper mixing of decaying manures with the soil they maintain just the amount of heat required to promote growth and prevent freezing all winter long, and they are justly proud of their success under this mode of culture.

The market gardens surround Paris for four or five miles out and the better ones yield a gross return of $1500 to $1600 per acre in crops, net $800 to $1000. The pride of these people is intense in their skill, and their love of the soil is most admirable. Vast quantities of vegetables go daily to England and Germany, so that Waterloo and Sedan are retrieved and forgotten in the returns of these marvelous achievements of French horticulture. Greater is he who makes two vegetables grow where but one grew before than all warriors; greater still he (the Frenchman) who makes one fine vegetable grow, where none grew before. The brainy hoe is mightier than the brutal sword. Just so in fruits and flowers and trees.

The marvel of conquest that the Parisians have gained over an inhospitable climate and an impoverished soil, continually excites your admiration, as you visit the flower markets of Paris, which are held every day in the year at Pont St. Michel, the Halles Centrales, and around the Madelaine, and as you examine the hundreds of fruit and flower shops throughout the city, and in the vast general market off the Rue Rivoli.

The city easily excels the world in the production and display of flowers and fruits and in the care of its shade trees, and daily thousands of strangers may be seen feasting mind and heart over the marvelous exhibits of the windows and stalls found everywhere in the city.

The variety of French beans, and the delicacy of their flavor excel all beans, and the kinds and flavor of so common a vegetable as the carrot, of which there are nine varieties for the table, and which at Vichi are a regular "cure" (liver and stomach) where thousands of patients go for the carrot diet and the medicinal waters—these are proof of the skill of the gardeners and of their knowledge of plants and soils.

The trees along the boulevards and in the parks of Paris are another proof. No municipal corps can make trees grow so close to great buildings, and in such shaded courts, and so close to the water's edge, and of such uniform heights and shapes on given boulevards and river quays as Paris does. No city has such simple, sensible plans for maintaining its parks and gardens and for decorating its public buildings and streets as Paris. You must come to the Porte Auteil at the fortifications, and see the Horticole Municipal, a farm-garden maintained by the city itself for the production and care of plants, trees and flowers for the decoration of the city. A ticket easily procured at the Hotel de Ville admits you with a party of five and you enter, on the last day of the year to see what the city can do to adorn itself from the laboratory of the soil. You first enter the camellia house (glass) where hundreds of these beautiful trees, some of them with tops three or four feet in diameter are standing in ranks one above the other, many in full bloom, and all in huge pots or tubs, ready to be moved at a moment's notice. Then the great palm house with its thousands of palms in jars and barrels, of all varieties, and all of the glossiest green. Many of these rise to fifteen and some to twenty feet in height. Then a long orchid house with a number of the choicest varieties, many in full bloom, and all in pots, of course. Then the azalea house, beautifully in blossom, and then the houses of the primroses and cyclamen and ferns and poinsettias and chrysathemums, each and every tree and flower and vine ready to travel; you visit last the wagon house where a dozen vans from small to great stand ready to transport these beautiful plants to any building, boulevard or gallery of the city. For instance, on the occasion of a visit of the king of Portugal, the great city hall (Hotel de Ville) with its vast stairways and salons and courts was decorated for a royal reception. A hundred men answered the telephone instructions and within eight hours the Hotel de Ville was a bower of beauty with flowers and vines, and rows and circles of ornamental trees reflecting from their glistening foliage the thousands of electric lights that illumined the reception of the king. A parade will pass for a mile along one of the great boulevards, one on which there happens to be no trees. An order flashes from the city hall to the Horticole and in four hours that boulevard is adorned in its whole length with a double line of handsome trees, through which the parade will pass.

Out of this garden come millions of pansy roots and foliage plants and violets, which will in spring and summer be set around the monuments, and in the places and gardens and parks of the city and will make them gay as paradise. All is as scientific and settled and sure in this system of municipal adornment as it is possible in human affairs to be, and it is delightful in the work and in the result. It looks as you cast your glance over the garden and then over the distant decorated buildings or boulevard, like a dream come true. Nothing but a deep and devoted love of the soil could work such enchantment under a city administration.

So in the great city markets, as you visit them in the early morning, every winter's day (as in summer, of course), they are overflowing with vegetables and fruits and flowers, grown, conserved, transported, with a victory over all weathers and seasons that challenges the world to a comparison. Strangers see but little of the hard but cheerful toil of these myriad faithful workers of the gardens, who give time and strength and skill to develop what these strangers so freely and so fully enjoy. Behind the great stone walls of the thousands of gardens they work unseen, but the reward and the honor are theirs in their devoted love of the soil.

Entomology and Bees

BEE LEGISLATION.

By J. G. Gilstrap, Ceres.

The subject of bee legislation has been one of absorbing interest to bee men in all parts of the state, and we, in this part of the valley, are greatly interested in the matter and were sorely disappointed in there being "nothing doing" at this session of the legislature. We cast in "our little mite" toward the passage of the bill. I went to Sacramento a few days ago carrying a petition with 144 signatures urging the passage of the bill. I saw some of the leading northern bee men and tried to persuade them to withdraw their opposition. While it must be confessed that the bill does not to our mind reach the full needs of the bee men, yet it is a step far in advance and we desired its passage.

At senate chamber I met most courteous treatment as well as by the bee men at Elk Grove. I learned that the senate committee had given two hearings to the bill and refused any further hearing in the matter, as they had received so much protestation from bee men at different places, claiming the bill had not been properly presented to the bee men for their approval or endorsement and that it did not cover the ground as it should.

The senators, a number of them, told me plainly that no legislation would be made by the senate until the bee men could and would get together in the matter and recognize the interests and wishes of the bee men of all parts of the state. Mr. Gates, the senator who introduced the bill in the senate, is one who takes this stand, and disfavors the present bill.

After a careful investigation of the whole situation we see there was no show at all. I was given to understand from senate members that a more favorable plan of law would be something along the lines of the horticultural commission. The senate members radically disfavor a "free service" proposition. They think it betokens a "nigger in the wood pile." And to eliminate county lines, that is to allow an inspector of one county to enter any adjoining county where there is no inspector, or where said official is not doing his duty, and clean up disease at expense of said county, would meet with more favor, and I believe there is no reason why the southern and northern and central bee men should not stand as a unit for a good law two years hence. I have had considerable to do with the southern bee men in the way of correspondence, and I credit them with honesty of purpose, and the same I must say of the northern bee men. So, fellow workers, let us keep the one object in view of a united move among the bee men of California. We keenly feel the situation, but with good will towards all.

THE HELP ONE ANOTHER CLUB.

We may beat our swords to plowshares
And our spears to pruning hooks,
And betake ourselves to farming
In the peaceful country nooks.
But we want them back as weapons
When we find at early dawn
That our neighbor's pesky chickens
Have been scratching up our lawn.

Oroville's citrus fruit shipments have been completed for the season.

THE ADVANTAGES OF GOOD COMBS.

By R. Beuhne, President, Victorian Apiarists' Association.

In the production of honey as a special business, or as a profitable side issue of other rural occupations, the frame hive is now in general use. The advantages it offers over the common box hive are, however, not availed of by a large number of beekeepers to anything like the fullest extent, and the best possible return is therefore not obtained.

To get the maximum yield of honey it is essential to have a good strain of bees, good management and good combs. The importance of the latter is often quite ignored by otherwise up-to-date beekeepers. Perfect combs for the brood chamber, as well as for extracting, cannot be obtained profitably from starters, but only from full sheets of foundation in properly wired frames and drawn out by the bees in the super of the hive when conditions are favorable.

It is admitted that good combs can be obtained from starters in limited numbers under certain conditions, but these conditions rarely exist for a sufficient length of time in our variable climate. The building of the combs by the bees requires so much supervision and attention by the beekeeper, that they are really more expensive than combs from full sheets of foundation, notwithstanding that the first cost of the latter is about eight times that of one-inch starters.

One of our largest apiarists, when asked whether he used full sheets or starters, replied "that he could not afford to use starters." The average beekeeper who uses starters gets a considerable amount of drone comb built in his frames. As drones are consumers, instead of producers, he occasionally cuts it out, compelling the bees to build it in again, which they usually do with drone cells. When the heads of the drone brood are shaved off with the honey knife, the bees remove the drones and the queen deposits drone eggs in the cells.

A worker cell measures 1-5 inch in diameter, and a drone cell ¼ inch. There are thus 25 worker cells or 16 drone cells in a square inch of comb. As a comb has two faces 32 drones are raised in the space which should produce 50 workers. The food used, and the labor of the bees involved in raising the former, are wasted, while the presence of drone comb in the hive is a check on the development of the colony in early spring and an inducement to swarming later on.

Beginners in beekeeping usually shrink from the expense of full sheets of foundation. They buy well-made hives and frames but use starters, raise enormous numbers of drones, lose a large portion of the honey yield in consequence, and then have combs which are liable to melt down in hot weather or break in the extractor. If economy is necessary it would be better to use home-made makeshift hives for a start, but good frames and full sheets of foundation. When the bees have earned new hives it is easier to effect the change than to replace the brood nest.

A frame of fully built out all worker comb is worth 1s. to the beekeeper; one largely consisting of drone cells is only worth the value of the wax it contains—about 3d. But the use of full sheets of foundation results in good combs only when due attention is paid by the beekeeper to several details.

Combs, whether for brood-rearing or the storing of honey, should be perfectly straight and built on to the frame on each of the four sides. To insure these qualities the frame should be properly wired and the foundation cut, so as to allow for expansion under the influence of the heat of the hive and the weight of the bees hanging on the sheet; further, it should not be given to the bees till the conditions are such that it will be worked on at once.

There are several different ways of wiring frames—horizontal, vertical, diagonal, W., M., etc. After trying them all I have found four horizontal wires the best for keeping the foundation straight without drawing in the top and bottom bar, as in vertical wiring, or leaving large unsupported surfaces of foundation, as in some of the other methods.

When four horizontal wires are used the bottom one should not be more than ½ inch from the bottom bar. The sheet of foundation should be less than the inside measurements of the frame by ⅜ inch in length and width. The exact dimensions cannot be given as they vary according to the different thicknesses of the bars of the various styles of frames. Fastening the foundation to the top bar and embedding the wires should be done when the foundation is warm and pliable, otherwise buckling is sure to result and the sheet will come away from the wires in places when the wax expands with the warmth in the hive. The board on which the frame is laid to embed the wires should be kept wet to prevent the foundation adhering. The bottom wire is embedded last and drawn upwards as far as it will allow, so as to form a low arch; the other wires are, however, kept straight. In this way a slight strain is kept on the foundation which will take up any subsequent expansion of the wax.

The trade size of foundation is such that the sheets are large enough for simplicity frames with ½ inch top and ¼ inch bottom bars. In the case of frames with thicker bars the foundation should be reduced in width to leave a clear ⅜ inch between the edge of the sheet and the bottom bar. Badly buckled combs may, however, result even when all these points have been observed, if the foundation is poorly made. Quite a number of beekeepers have roller mills and manufacture their own foundation; but, in many instances, the sheets turned out are little more than marked with the rollers and good straight combs cannot be expected from them. Well brought up foundation differs from that which is flat, in the same way as corrugated iron does from plain. In both instances, the flat sheet is less rigid and expands more under the influence of a rise of temperature.

The necessity of having straight combs for brood, as well as for extracting, is so self-evident that it is surprising so many poor combs are found in the majority of apiaries. It does not involve extra labor to produce good combs, but only the same amount done in a different way.

The disadvantages of crooked combs are: A reduction of the brood capacity of the combs, brace combs, difficulty in handling of frames, loss of time

(Continued on Page 511.)

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

EDUCATIONAL BUTTER SCORING CONTEST.

By Leon M. Davis, Davis.

The second entry of the California Butter scoring contest, scored April 4th, was participated in by twenty two California buttermakers, representing creameries from Imperial to Humboldt counties. The number of cubes was the same as sent to the first entry, although several new contestants replace those who have dropped out since then. The butter was scored by Mr. W. B. Thurston, who has recently come to the Coast as permanent representative of the U. S. Dairy division, and by members of the dairy department, who placed the scores as follows:

Grizzly Bluff Cr., Grizzly Bluff	94½
Laton Co-op. Creamery, Laton	94
Castroville Cr., Castroville	93
Dairymen's Co-op. Cr., Tulare	92½
Ceres Creamery, Ceres	92½
Santa Rosa Cr., Santa Rosa	92½
Elk Horn Cr., Santa Barbara	92½
University Farm Cr., Davis	92
Meridian Creamery, Meridian	92
Pozzi Creamery, Marysville	92
Elite Creamery, Nicasio	92
Willow Brook Cr., Penngrove	92
Stanislaus Cr., Modesto	91½
Cottonwood Cr., Cottonwood	91½
Salinas Creamery, Salinas	90½
Delta Creamery, Imperial	90½
Suisun Creamery, Suisum	90
Crescent Creamery, Los Angeles	90
Glenn County Cr., Willows	90

There is one thing in general that is noted from a study of the butter scores since the scoring contest began in 1909, and that is, a general improvement in quality of the finished product. Better butter is being sent in. Many of the competing buttermakers are working under conditions which are adverse to best results, but, even in view of this, are doing remarkably well. This leads one to believe that better methods are being practiced.

Some of the contestants report that their best cream is now being used to supply a sweet cream trade, and this puts them at a disadvantage. Having the poorer cream to work with, the plentiful use of a good starter will be found helpful; the amount and time of adding depending upon local conditions. The few warm days of the past week, when cream for the contest butter was delivered, were unfavorable in some parts, especially through the valley regions, and may account, in part, for the lower scores of some of the butter from those sections. A buttermaker who will stay with the contest regardless of unfavorable circumstances, is to be commended, and the suggestions made to him should be the more valuable.

Among the defects under flavor, several cubes gave evidence of a feed flavor. Such is likely to appear at this time of the year, and a liberal amount of starter will do much toward its disappearance. Four cubes were criticised for a high acid flavor, and in going over the method blanks these particular defects seemed to be due to either holding the cream too long, holding at too high temperature, or ripening to an acidity too high. When cream is received in the afternoon, it is often necessary to hold until the next morning before churning, but the buttermaker should bear in mind that butter keeps better than cream.

The number of mechanical defects was fewer as compared with the first entry. But two cubes were cut because of grittiness, and four for defective body. One piece was cut for mottles, and several were noted as being slightly mottled.

The criticisms under package were not unfavorable. One buttermaker sent his cubes packed in ice, and several took extra pains in the preparation of their boxes. A clean neat package is to be desired, as it indicates, to a certain extent, the care which is given to all parts of the butter making. All of the cubes arrived at Davis in due time, and when scored, had been in the refrigerator room for from 24 to 72 hours.

The call for third entry will be sent out late in May, and it is hoped that not only those who have participated so far, but many more will respond.

SORGHUM OR CANE.

Sorghum will produce immense quantities of fairly good quality of green forage or hay on shorter notice and with less trouble than almost any other crop.

An acre of good sorghum should produce three to five tons of fair hay. In composition this hay is slightly superior to corn stover (stalks without the ears), containing slightly more of all three of the food compounds. It has a greater advantage over corn stover, however, since it is more palatable on account of its sweetness, and is cleaned up better, the stalks being finer. It is relished by all kinds of stock if fed before starting to sour in the late winter. Take it all in all, sowing sorghum is one of the easiest ways of getting out of the difficulty caused by shortage of meadow.

Any good corn soil is good for sorghum. Sorghum appreciates warm weather even more than corn, and should be sown a week or two later. In the latitude of central Iowa the first half of June is about the right time, although it may be sown slightly earlier or several weeks later than this and yet produce a good crop. The seed bed should be prepared fully as well if not better than for corn. Young sorghum plants grow slowly at first and are very easily choked by weeds. The soil is best worked up by fall or early spring plowing, followed every week or ten days during the months of April and May by disking. This continual disking does important service by germinating and sprouting many weeds that would otherwise cause considerable trouble to the young sorghum; by warming up the seed bed, and by saving moisture. Sorghum deeply appreciates a deep, warm seed bed, free from weeds.

For hay sorghum is generally sown broadcast or drilled thickly, sixty pounds of germinable seed being used to the acre. This means about one hundred pounds of the seed usually bought on the market, as so much of it will not grow. Broadcasting is simply done by scattering the seed and following with a harrow. Generally we would prefer the drill, since slightly less seed is used per acre and a more even stand is secured. In the southwest sorghum and kaffir corn are

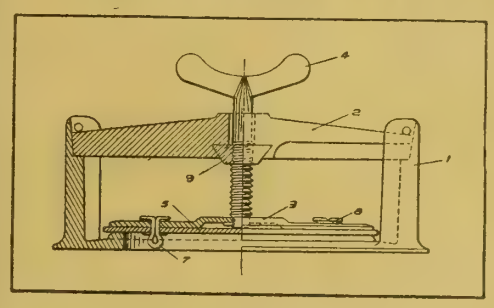
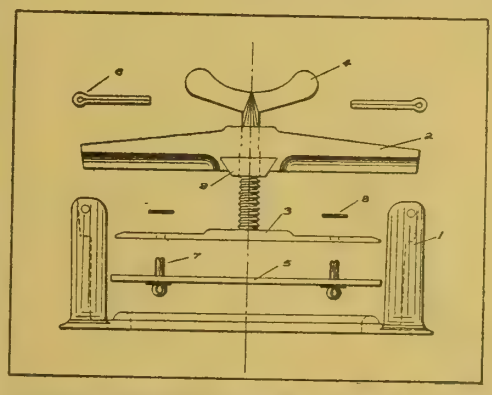
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

drilled in rows and given cultivation. In this way a larger grain crop may be secured, but the roughage is coarser Wallace's Farmer.

BUCKING HORSES.

A contributor to Bailey's Magazine writes entertainingly of the outlaw horses of the western plains. He says:

"Bucking horses may be roughly divided into two classes—wild horses and rogues. The former buck from fear and hereditary instinct, the latter with cunning and deliberation, and the steady improvement of consistent application and practice.

"Of the two classes, the first is more dangerous. Their inherited fear of man makes them wild to approach, difficult to saddle and mount, and uncontrollable when mounted, becoming almost mad and blind with passion when unable to unseat their rider.

"The rogue, on the other hand, bucks with deliberate coolness and precision, uses no more effort than is necessary to dislodge the horseman, and never loses more than the average share of good looks. On the sheep and cattle stations of New South Wales and Queensland, the station outlaw is almost invariably the best looking horse on the place, and is distinguished for the excellence of his paces or for remarkable stamina.

"I saw Pin Ears, the famous western outlaw, ridden in Colorado; a handsomer horse never stepped. A rich bay in color, short legged, deep shouldered, shore backed, he was the impersonation of quality and strength and showed the perfect symmetry that makes the machine-like accuracy of motion and marvelous stamina. And he 'pitched' as prettily as he walked. He was full of guile and cunning, and the side lurch with which he unseated one well-known horseman was one of the daintiest moves in the game that I have ever seen.

"Of course, from the very nature of his calling, the outlaw is generally in good condition, and therefore looks well; but the fact remains that he is usually a horse of good build, too; and all the worst-tempered horses I can recall in my experience have been as pretty as pictures. I am ready, however, to admit that the rule has its exceptions.

"It is not true that all buck-jumpers are mean spirited and cowardly. On the contrary, many of them, like the human rebels they resemble, are the very impersonation of pluck and courage, and any horseman who has owned and mastered an outlaw can testify that from no other has he won such loyal service and ungrudging labor or such true and lasting regard."

THE VALUE OF A TON OF SILAGE.

Silage, being so rarely sold, has no definite market value. The average cost of production of a ton of silage under corn belt conditions is about $2. Its feeding value, as compared with other feeds, has never been completely determined. It is rather difficult to compare it with such feeds as corn, oats and hay, since silage has a peculiar value on account of its succulence. The Maine station compared silage with mixed hay for dairy cows, finding that 100 pounds of mixed hay (mostly timothy) were equal to 440 pounds of corn silage. The conclusion was that with timothy hay selling for $10 per ton, corn silage is worth about $2.60 per ton for dairy cows. The New Jersey station compared corn silage with corn fodder, finding that for milk production a pound of corn fodder was about equal to two and three-fourths pounds of corn silage. With corn fodder at $8 per ton, this would give a feeding value to corn silage for dairy cows of about $3. At the Nebraska station it was found that corn silage was slightly superior, pound for pound, to sugar beets for milk production. With sugar beets at their present price of $5 per ton, this would give corn silage a value of slightly more than $5. Many loose estimates, ranging from $2 to $6 per ton, have been placed upon silage. Until a market price has been established for the stuff, we would think that a fair basis of selling would be the entire cost of production per ton, plus a reasonable profit.—Wallace's Farmer.

Under California. conditions and prices, silage would be worth materially more than in the East.

HEAVES.

There is no sure cure for an advanced case of heaves. Much can be done, however, to relieve the trouble. Some of the heave remedies now on the market have given excellent satisfaction when given before the disease progresses to any great extent. All medical treatment for heaves should be accompanied by a careful dieting. Only the very best quality of roughage should be given, and that only in small quantities. One veterinarian recommends avoiding dusty hay by feeding wet oat straw in winter and grass in summer. Another suggests cutting and dampening the hay. Helpful precautions are to water before and never after a meal. Horses affected with heaves require nearly twice as much rest after eating as ordinary horses. As a medicine, one-half ounce of Fowler's solution given morning and night in the drinking water, is recommended as good.—Wallace's Farmer.

California produces the only English walnuts in the United States; Orange county claims to produce 40 per cent of all grown in California, aggregating about $1,000,000 to the growers.

INBREEDING.

The breeding together of closely related animals, such as sire and daughter, dam and son, brother and sister, is known as inbreeding. By following this practice most of our pure breeds of livestock were originally established. For instance, in the Shorthorn breed, Charles Colling bred a bull by the name of Favorite to his own dam. The result of the mating was a heifer by the name of Young Phoenix, which was in turn bred back to her sire, Favorite, and produced one of the most famous Shorthorn bulls in history, Comet. Comet was a bull of such excellent quality that he sold for one tnousand guineas ($5,000). Many of the most famous breeding animals of history have been produced by even stronger inbreeding than was used in producing the bull Comet.

There is an old saying that "Nature abhors incestuous mating." In a measure this is true, but not in the sense which most people think it. Animals which have many strong qualities and but few weak ones when bred together intensify their strong qualities in the offspring. Thus it is that in the hands of a master breeder, inbreeding may be used to secure the most rapid improvement. But by breeding together animals that have several weak points in common, the undesirable points are intensified just as surely as are the strong ones, and the ultimate extinction of animals so bred is rendered quite certain. Possibly to this is due the failure of some of Thomas Bates' strains of Shorthorn cattle. In his inbreeding he apparently overlooked at times the qualities of constitution and ability to reproduce (breeding capacity). At any rate, some of his most famous strains were strongly inclined to be infertile.

In the hands of the real breeder, inbreeding is one of the most rapid methods of improvement, but in the hands of a careless breeder it is a most certain road to deterioration. A man who is breeding rather mediocre stock, especially if it be of scrub blood, should never use inbreeding. A man who has an excellent quality of stock and a particularly outstanding individual may sometimes practice inbreeding to great advantage. Any man who is thinking of following the practice of inbreeding extensively should read up on the work of the founders of our prominent breeds of stock, and should study the principles of heredity.—Wallace's Farmer.

Prior to about the year 1870 the Poland-Chinas averaged larger than now, were inclined to coarseness, or sponginess of bone, had much heavier, drooping ears, and were spotted with about even proportions of black and white. Since then the tendency each year has been to breed them with more black, until now those in highest esteem have identically the color and markings so long characteristic of the Berkshires, viz., solid black, with white feet, white tip of tail, a little white on or about the face and jowl, and occasionally a splash of white elsewhere. Their ears are medium or small in size, but still drooping, and are pliable and silky. A. C. Moore of Fulton county, Illinois, and D. M. Magie, of Butler county, Ohio, were the men who, by judicious selection, careful breeding and extensive exhibiting and advertising, probably did most to bring this stock of hogs in its early days, to wide and favorable public attention.—From Coburn's "Swine in America."

Abundant hair on swine, lively and somewhat fine and soft, growing out of a pliable skin, which is neither thick nor papery, and free from mangy conditions, tells the story of robust health, vigor, thrift and active circulation. The ideal hog should not be sleepy and sluggish, nor, on the other hand, restless and uneasy. Free action and a bright, sprightly manner are signs of good digestion and good health. If he is a comfortable, good-natured, friendly creature, wide-awake, disposed to visit with his owner instead of running away from him, and has the other points of excellence mentioned, he can scarcely fail to be a joy to his possessor and approximate, in the eyes of many, a thing of beauty.—From Coburn's "Swine in America."

In many phases of swine husbandry the question of location or climate has an important bearing. Where mild weather is apt to be the rule in late fall and early spring, breeding for two litters a year will obviously be considered in a different light than in a section much further north. The breeder in Canada or on the Atlantic coast will modify many matters regarding breed or feeds that are accepted gospel in the corn belt. Locally, the extent and kind of pasture at the breeder's disposal, like his other facilities and resources, will, to a greater or less extent, influence his practices.—From Coburn's "Swine in America."

Utah alfalfa growers have declared war on the alfalfa leaf weevil; this pest has almost ruined the alfalfa interests of the state. The last Congress appropriated $25,000 to study methods of destroying it.

One ranch of the Kern County Land Company is now supporting 700 head of cattle on a half section of land. This is considerably better than two head to the acre.

Live Stock Inspector Gordon of Kings county says that the reports of dogs and other animals dying of rabies are untrue and that poison has been the sole cause.

Two Visalia dairymen have been arrested because of unclean dairies.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market; 510, 511.

BETTER OUR HOME CONDITIONS.

In a farmers institute held in Central Illinois last month, at a session devoted to women's work on the farm, the statement was made that many farms which are well supplied with labor-saving implements for men's work show the woman's workroom, the kitchen, meagerly supplied. Many of the homes are small and cramped, while the barn is large, with every possible convenience; some have no sink, and the well from which all water must be carried is a long distance off; often there is no woodshed, even no woodpile; seldom a kitchen range; the one sure feature of the woman's work being that she has "board, clothes and a steady job." The session was devoted to the necessity of scientific knowledge and more conveniences for the farm mother. The city and the village are forced to insist on hygienic conditions to preserve life, but on the farm the necessity is not so apparent, and the matter is allowed to drift along without hygienic precautions or conveniences. We do not believe California homes are as illy furnished as the majority of Eastern farm homes, for as a rule a different class is found here, and home life is made more of, but we believe there is opportunity for improvement even in California rural home life.

ADULTERATED ORANGES.

The U. S. Department of Agriculture has issued food inspection decision 133 in which adulterated oranges are defined. It is interesting reading for some of our early orange shippers. Under this act "an article of food is adulterated 'if it be mixed, colored, powdered, coated or stained in a manner whereby damage or inferiority is concealed.' It is the opinion of the board that oranges treated as mentioned above are colored in a manner whereby inferiority is concealed and are, therefore, adulterated. These oranges having been shipped of a green, immature citrus fruit are thus held to be artificially colored, and the evidence shows that the change in color has not added to the sugar or acid content, neither has it made the fruit any more wholesome, while fruit remaining on the tree during the same period had increased its sugar content." The decision further adds that the use of such immature oranges is apt to result in serious disturbances of the digestive systems of children.

It is unfortunate that it takes a decision of the Department of Agriculture to instill common commercial honesty into our business methods, but that it is better than to continue shipping green oranges.

THE MAN BEHIND.

A meeting of orange growers was held at Tampa, Florida, a few days ago at which an address was made by Mr. Stubenrauch on the subject of decay of oranges under shipment. The address followed much the same lines as similar addresses by Mr. Powell, Mr. Stubenranch and others in this state, in a general way impressing the fact that greater care must be used by both picking and packing crews. During the address a grower asked the question as to what kind of clipper did the best work. Mr. Stubenrauch answered, "The clipper does not matter so much as the man behind it. Good work is done by all kinds of clippers and poor work with some good clippers." Later the speaker added that he had seen four or five per cent of cliper cuts with an implement which was supposed not to be able to make any cuts, so the matter of less decay, whether in California or Florida, comes back to the intelligence and carefulness of grower, teamster, grader, packer, and, in fact, everyone who has to do with the handling of the fruit.

WARNING.

We are informed by subscribers that agents of a mail order monthly publication are soliciting subscriptions, assigning as a reason that the Cultivator has been absorbed by the aforesaid publication; that subscribers to their paper will secure all that would otherwise appear in the Cultivator. These misrepresentations are made by irresponsible agents and we will appreciate any information our subscribers may send to us as to these statements. So far as we have learned such statements have been made in the neighborhood of Pomona, Lordsburg, Claremont, Uplands and along the foothills as far east as Highland in Southern California. The regular traveling agents of the Cultivator Publishing Company carry printed blank receipts and letters of authority signed by the Cultivator Publishing Company. The Cultivator has not been absorbed by any other publication, as stated by these solicitors and certainly we would not make any arrangement with any other monthly or weekly publication. The Rural Californian is the only monthly publication connected in any way with the California Cultivator.

POWER SITES IN NATIONAL RESERVES.

The forest service has recently adopted as one of its rules that fifty-year power site permits may be granted. Heretofore permits were revocable, but the new form of permit, while subject to various restrictions and regulations, plainly gives the company receiving it assurance of continuance. This protects capital and encourages the advancement of the country, and we do not see wherein exception can be taken to it. Under this regulation the rates to be paid to the government for these power sites are ten cents per horsepower the first year and ten cents per horsepower added each year thereafter up to ten years, when it remains at $1.00 per horsepower. It is estimated by engineers of the forest service that in California there are 300,000 horsepower undeveloped in the reserves.

RAISIN DAY.

Saturday, April 29th, is the day fixed for observation of Raisin Day, and it is hoped by the committee in charge that people will enter into it even more enthusiastically than similar days in the past. The committee has given out information in effect that a pound of California raisins represents a food value equal to six pounds of apples, five pounds of bananas, four and one-fourth pounds of potatoes, one pound of bread, four pounds of milk, almost five pounds of fish, and is even better than one and one-third pounds of beef. Besides their actual nutritive value, their medicinal value is great. Statements like these attract attention to this most healthful food which can but help the industry, and we believe proved helpful to those who are induced to eat more raisins.

Orange county boasts the largest onion ranch west of the Mississippi. It belongs to Mr. George Hall, and has sixty acres. Mr. G. A. Murdock is also one of the heaviest producers of onions in that county. Mr. Murdock shipped last year 140 tons of onion sets. This year's shipments will be greater.

Orange county papers are advising bean growers to refrain from contracting their crops in advance. Unless the grower is compelled to have an advance on his crop he should surely take this advice. The orange grower has proved this out to his satisfaction; even selling f. o. b. was proved to be a delusion and a snare; on a firm market the fruit was accepted and nothing more heard from it, but with a declining market it suddenly became "decayed" or some good reason appeared for its rejection. This forced the loss on the producer and gave the buyer all the advantage of the profit. Under the present selling delivered plan the grower takes his medicine on the declining market, but has the satisfaction of knowing that the advancing market redounds to his own profit. Let the bean men be as wise.

Every week many letters are received by the query department showing that subscribers have not read their papers carefully enough to notice that the question asked was answered fully in a recent issue. A complete article on a subject one week is no surety against receiving a request to answer that same question a week or two later. This necessitates much duplicating, which could be prevented if readers would file their papers—and save them much time in waiting for the information wanted. It is worth while to bear in mind that the semi-annual indexes make articles easily available long after the date of issue.

A reduction of the freight rate on citrus fruits from $1.40 to $1.15 is what the deciduous fruit growers have been working for for many years. It has finally been granted by representatives of the transcontinental lines who had the matter presented to them by a committee representing the State Fruit Growers Conventions, which has been working on the problem for years. The new rate will apply only to car lots and 26,000 pounds is the minimum shipment. The reduced rate will make a difference of $80,000 annually in favor of the deciduous growers.

Mr. George Robertson, formerly statistician of Fresno county, has been appointed to the newly created office of state statistician which is to be in connection with the state board of agriculture. Mr. Robertson will move to Sacramento to take up his new work for which he is eminently fitted, and which we doubt not he will take pleasure in perfecting.

Complaint comes from the Florida orange groves that the drouth is costing the growers a large amount of money. It has compelled earlier marketing of the fruit than anticipated, as many orchardists had aimed to hold until the heavy rush of California navels was off, but the drouth compels immediate picking to prevent shriveling of the fruit.

San Diego has a new enterprise in a sterilizing company which has a process of applying steam to ordinary stable and dairy manure, thus heating it to a degree which absolutely kills weed seeds, insects and fungus infestations. It is said to even increase the nutritive value of the fertilizer, while eradicating all pests.

Already the dried fruit producers of Orange county are planning a campaign for more perfect organization. A boost was given to the market last year by the action of this same organization, and we trust it may be the leader in the forming of other state associations, or a number of similar associations which will affiliate.

Agricultural News Notes of the Pacific Coast

Northern California

June 16 and 17 are dates selected for Oroville's Water Carnival.

The cherry crop of Solano county will be exceptionally late this season.

The annual picnic of University Farm at Davis is to take place on Saturday, May 6th.

Four hundred acres have been planted to cherries in one body at Wilton, Sacramento county.

A petition for the formation of an independent drainage district near Tudor, Sutter county, has been filed.

The peach crop of Butte county promises to be large and the present indications are that prices will be good.

With its first railroad in operation, Alturas, Modoc county, hopes for an outlet for its fruits, especially apples, which are grown to perfection.

The Plant Introduction Garden at Chico, Butte county, is sending out several tons of spineless cactus settings for experimental planting.

Farmers of Benicia, Solano county, are suing the Selby Smelting & Lead Co. for $14,000 for damage to live stock and family's health because of fumes.

At a meeting of the Petaluma Egg Exchange the members decided to suspend business and turn over their affairs to the Sonoma Fruit and Produce Company.

Butte county's horticultural commissioner reports that owing to severe storms the early part of the winter the crop of seedling oranges is forty per cent short.

The state board of health is making an investigation as to the ground squirrels of Butte county, especially with reference to their being infested with bubonic plague.

Owners of 13,000 acres of land in northern Glenn and southern Tehama counties will form an irrigation district under the Wright Act to secure water for their lands.

A combination has been formed of fruit shippers and growers under the name of Pacific Fruit Exchange, to be an independent marketing agency for the grower. It is capitalized at $500,000.

Central Creamery Company at Ferndale, Humboldt county, is pushing work on the big new dry milk plant which is the fourth of its kind in the United States; it will be ready for operation in a short time.

Citrus growers from Southern California made a trip of inspection over the orchards of Butte county and other sections of the Sacramento valley. It is reported that extended purchases of land may be made.

A mammoth dredger is on its way from the East to build levees to protect 60,000 acres of land reclaimed and colonized by the Natomas Consolidated. The lands are above Sacramento between the Bear and American rivers.

Spraying outfits of Butte county are busy on red spider, but unfortunately the attack was much earlier than usual owing to warm weather the latter part of March which hastened their maturity, and this has caused material loss to many fruit growers.

Central California

Hanford, Kings county, shipped a full car of eggs to Los Angeles one day last week.

The Fresno County Union has named a committee to investigate system of better roads for that county.

A Fresno fruit growers company has made arrangements to build and operate a large fruit packing house at Kerman.

The public school raisin day contest brought competing essays from 240 schools, many of which were east of the Rockies.

Peach men near Hanford, Kings county, sprayed extensively for peach leaf curl, which has heretofore been a serious pest.

Some of the lower orchards of the Pajaro Valley have been badly damaged because of silt deposited during the recent storm.

A Carnival and Products Exposition is planned for Merced May 16-20. The plan is to make it rival any similar exhibit made in Central California.

The Apple Annual Association of Watsonville is discussing the advisability of holding a flower show in connection with the next Apple Annual.

Kings County Bee Keepers Association held a meeting at Hanford last week, the principal subject of discussion being purchase of cans and cases.

The Pacific Coast Nurseryman's Association is to convene in San Jose, June 21st. George C. Roeding of Fresno is President of the association.

The Santa Cruz Poultry Association is establishing a buying agency through which members propose to secure all their poultry supplies and feed.

County Horticultural Commissioner Sharpe of Kings county reports some prune orchards showing severe early drop. On the whole he thinks a fair crop may be secured.

One bunch of 40,000 orange trees has been inspected at Porterville before forwarding to Terra Bella where they are to be planted. That district will plant about 2000 acres this season.

The state horticultural commissioner has appointed the county horticultural commissioners of 37 counties of the state to be quarantine guardians in their respective counties.

A committee of egg producers at Watsonville, Santa Cruz county, is investigating claims of an egg preservative which is promised to maintain eggs in good condition for a year or more.

The superior court of San Joaquin county has sustained the validity of the organization of the South San Joaquin Irrigation District. This act will validate bonds to the extent of $1,875,000.

County Horticultural Commissioner W. H. Volck, of Santa Cruz county, is sending out a great fund of information on various pests, and remedies for them. His last bulletin is on the canker worm pest.

The 12th annual Blossom Festival at Saratoga, Santa Clara county, was even more successful than any of its predecessors. It is estimated that 10,000 people from various parts of California were in attendance.

Southern California

A Riverside orchardist is using his automobile to do his spring plowing.

Corona, Riverside county, has secured the establishment of an alfalfa mill.

Calexico, Imperial county, offers free irrigating water to all property owners who will plant street trees.

Bee Inspector Wagner of Imperial county states that conditions for an unusually good crop of honey are excellent.

Ten thousand pounds of cotton seed have been shipped from El Centro into the Palo Verde Valley in eastern Riverside county.

Work is moving rapidly on irrigation ditches and general improvement of the irrigation system at Blythe, Palo Verde Valley.

The Mentone Heights Orange Company of San Bernardino county has decided to set 100 acres of oranges and lemons this spring.

A tract of 3500 acres in the Coachella Valley has been purchased by 300 Swedes who will operate it on a community or socialistic plan.

A meeting of alfalfa men was held at Arlington last Friday night to continue the formation of the Alfalfa Growers Selling Association.

Irrigators of Riverside and Orange counties have a force of men diverting over 20,000 inches of water of the Santa Ana river to gravel lands.

The bean growers of Sawtelle, Los Angeles county, anticipate the greatest bean output ever; last season's shipment aggregated 100 carloads.

Hay growers at San Jacinto, Riverside county, are starting their mowers on the earliest and biggest hay crop that section has ever raised.

The Pala Indians have just been alloted their lands, each Indian receiving 3¾ acres of irrigated land and 6 acres of grain land. There were 416 allotments.

Orange county lima bean growers are looking with cold indifference at the offers of $3.55 per hundred. Some independent buyers are especially anxious and have offered as high as $4.50 to $4.60.

The federal live stock inspector located in Imperial Valley fears that many tuberculous cows have been shipped into that section. The county supervisors are considering rigid rules regarding tuberculin tests.

Lemon growers note with some amusement the effort of the importers to create sentiment in favor of free lemons by pasting on boxes of imported fruit: "If lemons were free, this box would cost you $1.25 less."

The Chuckawalla Development Company has begun its final surveys for the intake and storage reservoirs. Twenty men are employed in this surveying corps. This system will carry water to nearly a quarter of a million acres in eastern Riverside county.

The Ventura County Dried Fruit Association has been incorporated with a capital stock of $50,000. The following are the directors for the first year: John Dent, William T. Neel, John W. Burson, F. E. Bagnall, A. L. Shively, A. Everett, Joseph Hobart, H. Warring and Allan Fraser.

The Coast

Portland will hold a Rose Festival June 5-10.

Sheep shearing at Walla Walla, Washington, began last week.

Colorado estimates an output of 10,000 cars of apples this year.

The Horse show at Salem, Oregon, was held last Friday and Saturday.

Extensive plantings of flax will be made on farms around Helena, Montana.

Muskmelons produced in Sinaloa, Mexico, are selling in Los Angeles at $1.00 each.

The second week of April saw land near Spokane, Washington, freeze so hard that plowing was stopped.

Horsemen of Pullman, Washington, are concerned over a serious disease causing much loss of young colts.

A train of 25 carloads of wheat of last year's crop was taken out of the Palouse country one day last week.

Big sales of reapers and mowers are being made by dealers at Hermiston, Oregon, to handle the greatly increased grain and hay crops.

The fifth annual Whitman County Horse Show at Colfax, Washington, last week brought out the finest exhibit of horses ever made in that section.

The United States Indian Service is favoring the building of the Wapato irrigation canal which will cover 140,000 acres of the Yakima Indian Reservation.

Farmers at Pullman, Washington, have made so general a fight on the ground squirrel pest that some farmers claim they do not see one in a day's ride.

A movement is under way to build a short-cut road from Prescott, Arizona, to Mint Valley, to connect with one of the best fruit growing sections in the state.

The creamery at Clear Creek, Oregon, reports an income of $663,000 and an average price paid for butterfat of 34 cents. The average price for butter was 21½ cents.

Walla Walla, Washington, was visited by the worst storm of the season last week; it will probably kill every peach, apricot and cherry in the valley, but grain farmers will be benefited.

The first wool sale of the year at Portland, Oregon, was made last week, when 100,000 pounds changed hands at prices from 9½ to 13 cents. The opening prices last year were 12½ to 16 cents.

The most valuable natural resources of the Island of Mindanao, P. I., are from the forests; some of the products are, gum, copal, guttapercha, tanbark, rattan. The most striking are orchids, many most rare ones being produced there. About 60 per cent of the area of the island is still in the native forest.

Farmers of Nez Perce county, Idaho, are embarrassed by rulings of the state board of equalization for a system by which they are compelled to pay the exorbitant tax of five to six dollars per acre per year. Other farmers renting land adjoining pay the usual rental of only $3.00 an acre. If the law is enforced it is claimed it will confiscate thousands of acres.

Loading carriers with asphalt at Trinidad Lake

Genasco

the Trinidad-Lake-Asphalt Roofing

Consider Genasco from the three vital standpoints:

1. **What it does**
2. **What it costs**
3. **What it saves**

1. Genasco waterproofs your roof to last. Trinidad Lake Asphalt, used in making Genasco, is Nature's everlasting waterproofer that has resisted the influences of weather-changes for centuries. It carries into Genasco these same weather-resisting qualities, and makes it defy rain, snow, wind, sun, cold, and heat; and it makes it *permanently* waterproof.

2. Genasco costs about the same in the beginning as the socalled "asphalt composition" or the "special process" roofings which would be wonderfully good imitations of Genasco if they didn't crack, break, and go to pieces. But they can't stand the real test—the weather. They haven't the lasting life which *natural* asphalt gives.

Genasco is economical because it resists and lasts.

3. The saving in Genasco Roofing is plain. You do away with leaky roofs and the expense of repairing them; you prevent costly damage to rooms and furniture, and you save the cost of re-roofing. Genasco first-cost is last-cost.

Get Genasco Roofing—either mineral or smooth surface. Guaranteed, of course.

The **Kant-leak Kleet** for roofing-seams prevents nail-leaks, does away with dauby cement, and gives a fine finish to the roof.

Ask your dealer for Genasco with Kant-leak Kleets packed in the roll. Write us for samples and the Good Roof Guide Book.

Box 53, Lincoln, Neb.

Practical Poultry Culture

TRAP NESTS.

In the Cultivator of nearly two years ago the following article on trap nests appeared, and now we have requests for copies of the article, which is out of print. We ask indulgence of other readers while we reprint for the benefit of those who have not preserved former copy. The article was a reprint of a bulletin of the Maine Station.

In all the experimental work with laying hens at the Maine Station use is made of trap nests. During the past year a new type of trap nest has been devised which is proving extremely satisfactory. The features in which this nest is superior to the type formerly used at the station are (1) certainty and precision of operation; (2) greater simplicity of construction, with less tendency to get out of order and work badly; (3) saving of labor in resetting the nest after use.

The nest is a box-like structure, without front, end, or cover, 28 inches long, 13 inches wide, and 16 inches deep, inside measure. A division board with a circular opening 7½ inches in diameter is placed across the box 12 inches from the rear end and 15 inches from the front end. Instead of having the partition between the two parts of the nest made with a circular hole, it is possible to have simply a straight board partition extending up 6 inches from the bottom, as shown in figure 1. The rear section is the nest proper.

The front portion of the nest has no fixed bottom. Instead there is a movable bottom or treadle which is hinged at the back end (figure 1). To this treadle is hinged the door of the nest. The treadle is made of ½-inch pine stuff, with 1½-inch hardwood cleats at each end (figures 2 and 3) to hold the screws which fasten the hinges. It is 12 inches wide and 12¼ inches long. Across its upper face just behind the hinges holding the door is nailed a pine strip 4 inches wide, beveled on both sides, as shown in figures 2 and 3. The door of the nest is not made solid, but is an open frame (figures 1 and 3), to the inner side of which is fastened (with staples) a rectangular piece of ⅛-inch mesh galvanized screening (dimensions 8 by 9 inches). The sides of the door are strips of ¾-inch beech stuff 12 inches long and 1½ inches wide, halved at the ends to join to the top and bottom of the door. The top of the door is a strip of hardwood 13 inches long and 1½ inches wide, halved in 2¾ inches from each end. The projecting ends of this top strip serve as stops for the door when it closes (figure 1). The bottom of the door is a hardwood strip 10¼ inches by 4 inches. The side strips are fitted into the ends of this bottom strip in such a way as to project slightly (about 1-32 inch) above the front surface of that strip, for a reason which will be apparent.

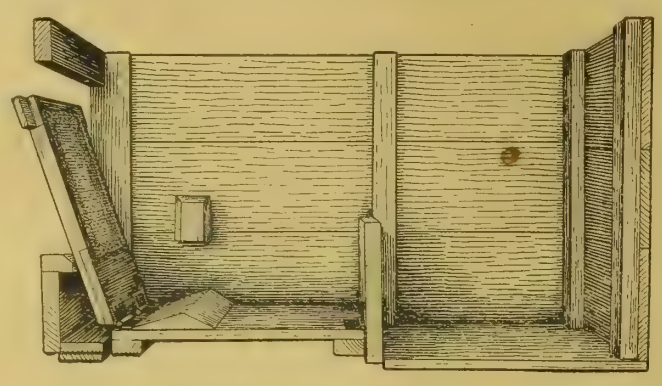

Fig. 3.

When the nest is open the door extends horizontally in front, as shown in figure 2. In this position the side strips of the door rest on a strip of beech 1½ inches wide, beveled on the inner corner, which extends across the front of the nest. This beech strip is nailed to the top of a board 4 inches wide, which forms the front of the nest box proper. To the bottom of this is nailed a strip 2 inches wide, into which are set two 4-inch spikes from which the heads have been cut (compare figure 2). The treadle rests on these spikes when the nest is closed. The hinges used in fastening the treadle and door are narrow 3-inch galvanized butts with brass pins, made to work very easily. It is necessary to use hinges which will not rust.

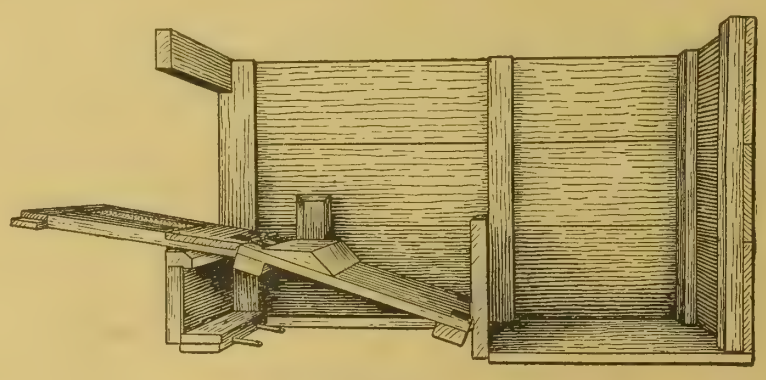

Fig. 2.

The manner in which the nest operates will be clear from an examination of figures 2 and 3, which show a sample nest with one side removed to show the inside. A hen about to lay steps up on the door and walks in toward the dark back of the nest. When she passes the point where the door is hinged to the treadle her weight on the treadle causes it to drop. This at the same time pulls the door up behind her, as shown in figure

Coulson's
MADE IN PETALUMA

Special chick food

If nature hatches the egg, you should save the chick. And you can do it with Coulson's Special Chick Food—the greatest life-saver known in the chicken industry.

This food is the result of years of study to get just the right ingredients in a proper mixture to save the largest possible number out of every 100 chicks.

Coulson's Special Chick Food is an investment, not an expense. It pays big dividends by starting chicks on the road to profit for you. Costs about one cent a chick for four weeks' feeding.

Coulson's Growing Chick Food must be used after the first six weeks, to keep up the steady growth of the chicks up to three months, at which time they are old enough to use Coulson's Egg Food—the standard feed for laying hens.

At your dealer's or from us. Write for the interesting book, "Poultry Feeding for Profit." It's free.

3. It is then impossible for the hen to get out of the nest till the attendant lifts the door and treadle and resets it. It will be seen that the nest is extremely simple. It has no locks or triggers to get out of order. Yet by proper balancing of door and treadle it can be so delicately adjusted that a weight of less than half a pound on the treadle will spring the trap. All bearing surfaces are made of beech because of the well-known property of this wood to take on a highly polished surface with wear. The nests in use have the doors of hardwood, in order to get greater durability. Where trap nests are constantly in use, flimsy construction is not economical in the long run. For temporary use the nest door could be constructed of soft wood.

The trap nests are not made with covers because they are used in tiers and slide in and out like drawers. They can be carried away for cleaning when necessary. Four nests in a pen accommodate twenty hens, by the attendant going through the pens once

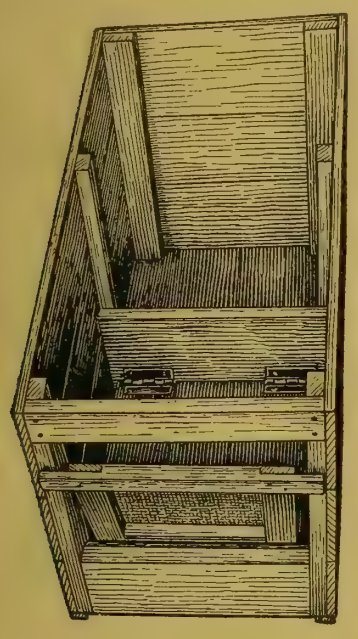

Fig. 1.

an hour, or a little oftener, during that part of the day when the hens are busiest. Earlier and later in the day his visits are not so frequent. The hens must all have leg bands in order to identify them; a number of different kinds are on the market. The double box with the nest in the rear is necessary. When a hen has laid an egg and desires to leave the nest, she steps out into the front space and remains there until she is released. With only one section she would be likely to crush her egg by stepping upon it, and thus learn the pernicious habit of egg eating.

To remove a hen, the nest is pulled part way out, and as it has no cover she is readily caught, the number on her leg band is noted, and the proper entry made on the record sheet. After having been taken off a few times the hens do not object to being handled, most of them remaining quiet, apparently expecting to be picked up.

Before commencing the use of trap nests it was thought that some hens might be irritated by the trapping operation and object to the noise incident to it, but such does not seem to be the case. Trap nests have been used at the Maine Station for Leghorns, Brahmas, Wyandottes and Plymouth Rocks.

The amount of time required in caring for the trap nests can only be estimated, since the attendant's time is divided with other duties. The time varies from one day to another and with the number of nests in use. By noting the total time used each day in caring for the nests when the hens were laying most heavily, it has been estimated that one active person devoting his entire time to trap nests could take care of 400 to 500 nests used by 2,000 to 2,500 hens. When commencing the year's work he would need assistance in banding the birds, but after that was done he could care for the nests without assistance until midsummer, when the egg yields would probably be diminished and a part of his time could be spared for other duties.

ANOTHER GOOD EGG RECORD.

I read with much interest the article from Mr. E. B. Stone in recent Cultivator, giving egg record and feed for hens. I would say it is a fine record. I have not kept a record for so long but can give results so far. My hens began laying about February 1st. During February my first pen of five hens laid 105 eggs; to date in March (17th) 52 eggs, and the second pen May hatched pullets, laid in February (three hens) 152 eggs, in March to 17th, 122 eggs. I suppose others have much better records, but if they keep this up long enough it will make a very satisfactory record to me.

I feed soaked barley in morning and Egyptian corn at night. Then feed in hopper as dry mash equal parts of bran and shorts with one-sixth part added of meat scrap. This they can run to all the time. The grain I feed according to the appetite of hens.—G. L. Hawley, Madera.

Every breeder should study the standard and become familiar with their breed. This is the only way to breed up your strain. One can not discard poor breeding fowls unless one knows the faults of the birds. It is very important that you know your own breed if you expect to stay in the poultry business.

A mixture of sulphur, lard and coal oil, applied warm with a brush, is a sure cure for scaly legs. Apply twice at intervals of a week, being sure at the same time that all insect life is killed on perches.

Heavy Fence
For Economy

WOVEN-WIRE FENCES must be heavy as they have to turn animals by sheer strength of the wire. A fence with barbs is protected from excessive pressure because the animal fears the barbs. Remove the barbs and the greatest strength of the animal is thrown upon the fence. Its wires must be larger and stronger. To have a long-life woven-wire fence the fence must be heavy.

AMERICAN FENCE

is a thoroughly galvanized square mesh fence of weight, strength and durability. Large wires are used and the whole fabric is woven together with the American hinged joint (patented)—the most substantial and flexible union possible. Both wires are positively locked and firmly held against side slip and yet are free to act like a hinge in yielding to pressure, returning quickly to place without bending or injuring the metal.

Dealers Everywhere—Stocks of American Fence are carried in every place where farm supplies are sold. The Fence is shipped to these points in carload lots, thereby securing the cheapest transportation, and the saving in freight thus made enables it to be sold at the lowest prices. Look for the American Fence dealer and get the substantial advantages he is enabled to offer. He is there to serve the purchaser in person, offer the variety of selection and save the buyer money in many ways.

White Leghorns

A Standard Strain of Great Layers and Great Winners. None superior. Prices reasonable. Descriptive booklet of our stock and farm and recipe for mixing best and cheapest egg-producing mash, sent free for stamp. Eggs, stock and baby chicks for sale. Also a grand lot of cockerels.

On a separate farm, we have an extra fine lot of Buff Orpingtons, from which we can furnish stock, eggs and baby chicks at popular prices.

MODEL POULTRY FARM Irvington, Alameda County, California

This open front door makes perfect ventilation

Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs*. Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

NEW OUTDOOR BROODER
Heated—Storm-proof

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

GEO. H. LEE CO., **LOS ANGELES, CALIF.**
225 West Second St.

KING COTTON

(Continued from Page 483.)

ico, 852, and Imperial, 802. With the coming season this will be increased, as the area planted is estimated at 50,000 acres. Also it is hoped that there may be an increase in painstaking care. As may be noted in the above quotation, while 15,000 acres were planted, there were about 10,000 which had "reasonably proper care." Such a proportion is out of all reason and shows the proneness of humans to enter into enterprises which promise well without due consideration or preparation. The buying of good seed, putting it into good ground and applying good water, and then not following these various steps intelligently to the end, is worse than a blunder. It has been stated that land values in the Imperial are too high for "shotgun" methods of culture.

Besides the immediate industry of cotton growing and ginning, an oil mill has become one of the money-saving adjuncts. The labor question seems to have solved itself between American pickers and an occasional Mexican or Indian. A few colored pickers have been induced to come from Southern localities, but their help has not been found necessary.

MEXICO AS A COTTON PRODUCER.

Mexico has long been a producer of cotton, but the primitive methods and lack of any effort on the part of the people to extend the planted area have so far made Mexico count but little in the world's production of cotton. All of this promises to change, however, as American farmers now in Mexico are making a specialty of cotton and proving that this staple can be produced economically and at a very satisfactory profit.

The most important development in the growing of cotton in Mexico, fostered by Americans, is that now in progress in the Yaqui Valley, in the state of Sonora. Here there is a large and prosperous colony of American farmers, nearly all of whom are Californians. Experiments have been conducted on an extensive scale for two years in the growing of a number of varieties of cotton, and the results have been more than satisfactory. This season the American farmers in the Yaqui Valley are planting about 2,000 acres of cotton. The larger part of the seed for this planting was shipped into Mexico from the Imperial Valley. As experimental plantings in the Yaqui Valley showed from 1½ to 2½ bales to the acre, the farmers there are confident of averaging not less than one bale to the acre. A cotton gin is now being erected near the town of Yaqui. If this season's work proves profitable, there will be no less than 10,000 acres of cotton in the valley next year.

Cotton in the Yaqui Valley will be grown almost entirely under irrigation, as is done in the Imperial Valley. Cotton is planted in the Yaqui from April 15 to June 1, and is irrigated until the summer rains in July and August. Usually these rains are sufficient in volume to mature a cotton crop. During the picking season, however, there is no rain, and the cotton may not only be handled in a leisurely manner, but it will be safe from the injury that frequently results in the South because of heavy rains during the picking season.

The American farmers in the Yaqui Valley claim a great advantage over the cotton growers of the United States in the low price of their labor. It has been demonstrated that the Mexican cotton picker handles about as much cotton in a day as the negro picker of the South. The advantage lies in the fact that the Mexican laborer is paid only from 50 to 75 cents per day in American money. In the cultivation of the crop and in all other work attendant upon its production, Mexican labor is used, and this evidently will result in a further advantage to the American farmer now in the Yaqui Valley.

In the matter of price, these Yaqui Valley farmers expect to do as well or better than the cotton growers of the South, as Japanese cotton buyers have already agreed to take the entire crop. The growers will have to ship the cotton only seventy-five miles by rail to the Port of Guaymas, where it can be put on ships for the Orient, or for any other of the world's markets.

HOLTVILLE.

EL CENTRO.

A Red Bluff stock raiser claims that section of Tehama county has a material advantage over most other sections because of excellent grass pasture for beef cattle; a bunch of steers were recently sold at an average price of $63.25 per head.

San Jacinto, Riverside county, has promise of an exceptionally good crop of honey.

READY FOR MARKET AT THE IMPERIAL GIN.

Irrigation and Forestry

BUYING EASTERN FOREST LAND.

The Department of Agriculture announces through a circular which is just coming from the press, that it is ready to begin operations looking to the purchase of land by the National Forest Reservation Commission created under the Weeks Law.

This law was passed with special reference to the creation of National Forests in the Appalachian and White Mountains. Under it the secretary of agriculture is to examine, locate, and recommend to the commission for purchase such lands as in his judg ment may be necessary for regulating the flow of navigable streams. The circular which is now being printed is intended to give information to the public as to where and what kinds of land are wanted. Owners of land the purchase of which will be considered by the government, are expected on the basis of this information to make known to the Forest Service, which will conduct the work for the Department of Agriculture, their desire to sell.

The law is not restricted to particular regions, except that lands may be bought only in the states whose legislatures have consented to the acquisition of land by the United States for the purpose of preserving the navigability of streams. The states which have already taken the necessary action are Maine, New Hampshire, Maryland, Virginia, West Virginia, North Carolina, Tennessee, South Carolina and Georgia.

The first lands to be examined for purchase will be in the Appalachian and White Mountains, which because of their altitude, steepness, and lack of protection are in a class by themselves. The area which is believed to need protection is much larger than the government can purchase. Much difference exists, however, between different parts of the region. Careful examinations which have been going on for the last ten years have proved that the conditions which affect stream flow to an extreme extent are to be found in relatively limited areas, which are scattered more or less widely. By careful selection it is believed that much can be done for the permanent improvement of the watersheds with the purchase of a relatively small part of the land.

Timbered lands may be bought either with the timber standing on them or with reservation by the owner of the right to cut the timber under certain rules to provide for perpetuation of the forest. These rules will form a part of the agreement for the purchase of the land. Since, however, the government can not pay high prices, it is not regarded as probable that much land bearing a heavy stand of merchantable timber can be bought. Culled and cut-over lands may be bought, as well as land covered with brush which is useful for watershed protection, burned land, and abandoned farm land, whether cleared or partially or wholly covered by young timber growth. Good agricultural lands will not be considered. Owners may reserve the right to remove valuable mineral deposits which are known to exist.

Proposals will be received for small as well as for large tracts, although small tracts can be examined only where the purchase of a considerable total of land in the same neighborhood is under consideration. With regard to the price which can be paid, Secretary Wilson indicates that the policy of the commission will be to make the money available go as far as possible. "For the most part," he says, "we shall have to buy cut-over lands or lands without much merchantable timber. I want to make it plain at the start that I shall recommend this class of land only when it is offered very cheap. Proffers of land at exorbitant prices will not be considered. I am frank to say that I hope to see a great deal of public spirit manifested by land owners. I expect some lands to be offered at merely nominal prices in order to aid the government in getting well started upon this wise and necessary policy.

"The lands acquired by the government will be held as national forests. They will be protected from fire and the growth of the timber will be improved as much as possible. The lands will not be game preserves, but will continue to be open to the public for hunting and fishing in accordance with the laws of the state in which they are situated. All their resources will be available for the public under reasonable conditions. Another point which I wish to emphasize is that we are not going to take from people their homes in order to put the lands into national forests."

WELL-DRILLING LORE.

The deepest well in the United States is near West Elizabeth, Pa. Its bottom is 5575 feet beneath the surface. The deepest well in the world is in Germany and is 6572 feet deep. A more remarkable well, perhaps, reaching a depth of 3600 feet, was drilled for petroleum in western China by primitive methods and by means of such crude appliances as a cable made of twisted strands of rattan.

These facts and much other interesting information concerning underground supplies of water and oil and methods of getting at them are given in a report entitled "Well-Drilling Methods," by Isaiah Bowman, just published by the United States Geological Survey as Water-Supply Paper 257. The report is comprehensive and well illustrated, covering 130 pages and containing plates and figures, and may be considered one of the semi-popular publications of the survey.

Sandstone Wells Among the Best.

All rocks contain some water, but some formations, such as the granites, carry only an inappreciable amount. Sandstone, on the other hand, has an absorptive capacity of a gallon or more of water per cubic foot of rock and is the best water bearer of the solid rocks. Wells sunk in sandstone are usually drilled and the water derived from that rock is seldom polluted. To those who are contemplating sinking wells or increasing their water supply from underground sources this report, taken in connection with another report recently published by the survey, "Underground Waters for Farm Use," will be of interest.

Chinese Are Pioneer Well-Drillers.

Water-Supply Paper 257 traces the history of well drilling from its earliest practice in China down to date and contains descriptions of the many methods of drilling now in use in the

We are prepared to furnish on Short Notice

Straight Knives

Of All Sizes

For the Monarch

And Other Cultivators

This is the season of the year when every effort is put forth to get rid of weeds, and we have the best tools for this purpose to be had.

The Killefer Cyclone Weeder

We have Killefer Cyclone Weeders of all sizes on hand. This is a most effective tool for keeping down the growth of weeds after rains or irrigating on orchard, beet, bean or grain land. Guaranteed to do twice the work with the same team of any other tool. As the knives overlap each other, it is impossible to leave anything in their course.

Built in 6, 8, 10 and 12-foot sizes. Blades can be attached to cut in or out as desired.

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull-power, high baling chamber, positive plunger rebound: it stands up to its work, no taking off of wheels. Has record of 30 tons per day. We will ship you one today. If you don't want it we will pay freight both ways. Write now.

ARNOTT & CO., 118 South Los Angeles St., LOS ANGELES, CALIF.

United States, including not only drilling for water but for oil and other resources. The credit of reducing well drilling to a science belongs to the Chinese, but in this, as in many other things, the Chinese engineers have made but slight improvement during the last century, which has witnessed so remarkable an advance in mechanical development in the United States.

Many Kinds of Well-Drilling Rigs.

Mr. Bowman regards the use of well casing as the greatest improvement yet devised for oil drilling and notes that holes can now be sunk safely and rapidly to a depth of 5000 feet. He describes the various tools and rigs required for different kinds of drilling, ranging from those required for the shallow hand-driven well of perhaps 20 feet to those used in drilling wells of maximum depth.

Methods of Recovering Lost Tools.

"How can work proceed when a drilling tool is lost in a deep well?" is a question which may often be asked by any person unfamiliar with methods of well drilling. The recovery of lost or broken drilling tools is, in fact, one of the most difficult features of well drilling. Simply to ascertain the nature of an accident which has occurred half a mile below the surface in a hole perhaps only six inches in diameter requires some skill. Many devices have been perfected for capturing lost tools, and the necessity for first learning the shape of the upper end of the tool and the position in which it lies in order to proceed to recover it has even led to the invention of a small camera which can be lowered to the bottom of the hole to take a photograph showing the conditions. Electricity is, of course, the agent employed in operating the device.

WATER POWERS OF THE CASCADES.

The perfection of methods for transmitting electric power over long distances—200 or even 300 miles—which has been attained during the last few years and the reported rapidity with which water power properties all over the United States are being acquired by corporations and individuals have brought sharply to public attention the great asset which the people of the country have in the undeveloped water powers of the public domain.

No area in the United States, it is believed by engineers, presents more favorable opportunities for the development of water power than that traversed by the Cascade range, a large proportion of which is still owned by the government. The general elevation of the summit of this great plateau is from 6000 to 8000 feet, and many of its lofty peaks extend into the region of eternal snow. Among these peaks are Mount Baker, Mount Rainier, Mount Jefferson, and Mount Shasta, all over 10,000 feet and two of them between 14,000 and 15,000 feet high. The streams draining the Cascade range have steep slopes and are fed during the low-water period by the many snowbanks and glaciers that mantle the high peaks or by the liberal supplies of ground water that exist in this region. The precipitation on the area is abundant, although its distribution is by no means uniform. The streams possess the features requisite for water power development—rapid fall, abundant water, and comparative uniformity of flow—and the almost unlimited resources of timber, mines and soil, as yet hardly touched, afford a promising market for these water powers and fix for them a high potential value.

The United States Geological Survey recently published, as Water Supply Paper 253, a report on the water powers of the Cascade Range in Southern Washington, by John C. Stevens. This is the first of a proposed series to be issued, one each year, dealing with the water powers of the streams flowing from the Cascade Range in Washington and Oregon. The evident interest in the subject of the report resulted in the almost immediate exhaustion of the edition, and it has just been reprinted and can now be obtained by application to the director of the survey at Washington.

Important Power Streams.

The streams considered in this report are Klickitat, White Salmon, Little White Salmon, Lewis, and Toutle rivers, and other streams in the drainage basins of these rivers, all of which were surveyed under the direction of Mr. Stevens by engineers employed by the United States Geological Survey and by the State of Washington, acting in co-operation.

These streams are all tributaries of the Columbia. The most important of them, considered as a source of power, is Klickitat River, which will furnish 154,000 horsepower at low water. The survey of the Klickitat covered 73 miles and included a total fall of 3255 feet. The White Salmon, Lewis, Toutle and Little White Salmon take rank as sources of water power in the order named.

Enormous Water Powers Involved.

The entire system of streams surveyed will afford about 395,000 horsepower. The total water power available in the Columbia River Basin has been estimated at 10,500,000 horsepower, so that the region covered by this first report will furnish only 4 per cent of the enormous aggregate, yet even this small percentage is five times the amount of water power already developed in the state of Washington.

The report contains descriptions of the rivers named and of their important tributaries, with tables showing stream discharge, the results of an extensive system of stream measurements, location of water power sites, and the amount of power available at each site, annual mean and minimum discharge of representative streams of the northwest Pacific coast, and rainfall at numerous places in Washington and Oregon, also a summary of the water laws of Washington.

A valuable portion of the report is a series of plans and profiles showing the course and gradient of each stream surveyed.

WATER SUPPLY OF THE GREAT BASIN.

The Geological Survey's census of the water resources of the United States is contained in a series of its reports called "water-supply papers," the latest issue of which, No. 270, is devoted to the waters of the Great Basin, comprising western Utah, nearly all of Nevada, and parts of Idaho, Oregon and California. The report describes the general features of the basin and gives the discharge of the most important streams of the region as shown by measurements made at numerous stations during the year 1909.

Water Used Chiefly for Irrigation.

In this arid region water is precious and is applied mainly to irrigation. The Truckee-Carson and Strawberry Valley projects of the United States Reclamation Service and a number of private projects are designed to utilize the waters of some of the streams measured. Three of the streams—City, Parleys and Emigration creeks—furnish most of Salt Lake City's water supply.

Water Powers Unutilized.

The flow of some of the streams has been used to generate electric power, and there are many unutilized sites for good power plants. The report notes that more than 100,000 horsepower is available without storage in Owens River basin alone. Three power plants installed on Truckee River generate about 2,500 horsepower each.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Gophered Trees.

How should I treat orange trees that have been gophered?—Subscriber, Corona.

We have seen trees that were gophered for several inches above and below the surface of the soil, which were found soon after the mischief was done. Around them was packed a quantity of moist soil, kept moist for several days. Grafting wax applied soon after the injury may be equally as effective. As noted, these

Bridge-grafting of a girdled trunk.

treatments are for a fresh wound which will granulate and form new bark especially if the wound occurs when there is full sap, and the tree afterward will scarcely show its injury. The case observed fortunately occurred at growing season; in dormant season the healing could not take place and the bark may die before the growing season comes. If the wound is so deep that the inner bark, or even the sap wood is gnawed away, or if the wound has thoroughly dried, it is impossible to induce granulation and build up the bark. Then the only salvation is to carry the sap from the root to above the wound by bridge grafting. We have seen this done where the sap was carried in this way to maintain tne life of the tree while the bark grew both from above and below until union was formed. This is a delicate operation, but with care successful.

Root Knot.

How can I prevent black rot in my orchard? The trees are old and when I remove them and plant young trees instead, they grow slowly and many die. The trees are peaches and apricots.—N. E., Kingsburg.

"Black rot" is a trouble affecting fruit of peaches and apricots, but is not worth considering in California. We wrote to the inquirer and asked for specimen of bark. He replied by sending parts of bark and a good healthy root knot. To be sure of our diagnosis, however, this was sent to the Southern California Pathological Laboratory and Mr. Clayton O. Smith answers that it is plainly a case of crown gall or root knot, a bacterial disease causing these knots about roots and crown of tree. Nothing has been found that will free the soil from this trouble and similar trees planted in the same ground are sure to be affected in the same way. If the ground can be cleared of trees and given clean culture to garden or some other crops for a few years, it will again be possible to plant peach root in it.

Black Spot of the Orange.

I note in the Cultivator of March 9th your answer to T. J. L. of Alhambra in regard to black spot of the orange. You quote Dr. J. Eliot Coit in effect that the trouble is caused by a fungus, when in reality it is caused by an insect which attacks the fruit early in the season, probably April or May, and the destroying of the fruit after it drops would have no bearing on the case whatever. If anyone doubts this statement, I can prove that I am right.—V. L. Martin, Glendora.

Our subscriber will surely have to produce some remarkably strong proof to convince our readers that Dr. Coit's statement is incorrect. The determination of the fungus condition of this disease is so definite that there can be no question whatever about it, and while Mr. Martin may have observed some injury by insects which has caused dropping, he has failed to make careful examination of this fungus.

Rolling Onions.

This being our first year in California, we have formed the habit of depending upon the California Cultivator for much information and it has become our most efficient guide in every department, and we now come to you for advice. When should the tops of onions be rolled so as to make the bulbs form, and how can they be most successfully dried to prepare for the market?—W. C. H., Spring Valley, San Diego county.

The modern onion grower does not rely upon the process of rolling the tops to "make the bulb form." If the bulb does not form in the natural way, no amount of rolling will avail. "Thick necks" are caused from improperly grown seed, usually. Thousands of pounds of onion seed are annually sold that would better never have been put on the market. Very often we might lay the blame on the buyer, who so frequently demands that the seed shall be cheap. It costs money to grow good onion seed and such seed is never low priced. It took Gilbertson, the noted onion grower of Iowa, a quarter of a century to produce the beautifully colored, shapely, long-keeping onion he now grows.

The climate of California makes it comparatively easy to cure and prepare the onions for market. When the crop has ceased to grow and the bulbs have formed, they are pulled and allowed to remain on the ground for about a day, when they are put on small piles and covered with straw or weeds, or any material that will shade them from the direct rays of the sun. They can then be sacked and marketed at the pleasure of the grower. It is well to sort them at the time of sacking, making at least two grades. In trimming the bulb at the time of sacking, do not cut either stem or root too close to the bulb, but sufficient should be taken off to give a neat appearance. Leave on all the hull.—Q. A. L.

Hog Cholera.

In which states is there hog cholera or swine plague? How many animals die of that disease in this country, and is there any successful remedy?—Subscriber, New York.

Industry informs us that the number condemned in packing houses over the country is a matter of record and can be secured from the central office of the bureau at Washington, but the number which die on the farms has never even been estimated. The nearest to anything definite which can be secured on that point is: "In many of the states of the Union the financial loss of each exceeds a million dollars a year." The disease was first introduced into Ohio in 1833 and for many years was confined to that state and the middle western states; it has now spread so that there is no section of the country exempt.

There is a treatment or preventive rather, which is almost perfect in intelligent hands; it consists of the injection of a serum invented by an investigator connected with the Bureau of Animal Industry, M. Dorset. The process is patented but given by the department for the free use of all. This treatment is described in Bulletin 379. The effect of the serum is limited as it lasts for only a few months, usually not exceeding six. The animal may be made immune for life by inoculation with blood from a diseased animal, or where others in the herd are affected, this is sufficient. Of course in addition to the injection of serum, cleanliness and other factors are essential.

Trapnests.

Can anyone give me plan for constructing trapnests?—Subscriber, Goshen.

The inquirer is referred to reprint of an article in a former Cultivator which appears with illustrations in the poultry department this week. We will ask our subscribers for plans which they have found efficient.

Crops Between Rows.

I want to settle on six acres of first-class citrus land, and I need to do this on account of the health of one of my children, and then I wish to make a home of it. Now, what I want to know is this: What, if anything, could I grow between the rows for the first two years if I plant the same to oranges? This place will have car line connection with Los Angeles, and will be about sixteen miles away. It is a vital problem that has its health side and its economic side, and I wish that you would give me some suggestions in your valuable paper. The idea is to raise something to help make the living until I can get the orchard in bearing. I have the land clear and will have only about $2,500 when I arrive. Hoping for a reply in your columns, I remain, Subscriber, Penfield, Mich.

This is a good question and states conditions which should bring success to our Michigan subscriber when he arrives in California. We assume that on the land he is to construct a home, purchase implements and what little stock he may need, and live until the place produces sufficient for the support of his family. If he is the right kind of a man and has the right kind of a family, there is promise for complete success with these conditions. All we know regarding the location of the land is that it is sixteen miles from Los Angeles. As there are lands in that radius of all imaginable kinds and conditions, we can only give the merest general suggestions. It seems that it is all to be planted to oranges, though we trust a family orchard will be given a little nook, for that is part of the living and means a consequent reduction in outgo. As to planting between rows, we have seen instances where it succeeded admirably, though in general we would say there is better promise for the orange grove which has not that handicap. But with care in restoring fertility and in keeping clean culture as far as possible from the trees, it will succeed. Above all, there must be sufficient water so that the garden or other intercrop does not thrive at the expense of the permanent trees. If the ground is of a sandy loam nature and suitable for potatoes, and also located where one can get an extra early crop, especially if it could be marketable at this time, there is good money in potatoes. Strawberries, raspberries and other small fruits have also been employed in situations of this kind. Of course, the whole range of garden products might be mentioned, and which one would be best could only be determined by an examination of the land and a good look through the markets to be supplied. Perhaps the best crop of all to raise between trees, and one which benefits instead of impoverishing, is poultry. With proper attention to detail and willingness to work in season and out of season with them, poultry is most profitable. The determining factor should be past experience of the inquirer. What has been his work, and how much tiring labor is he able to do? Some crops require more manual labor than others. Definite answer can only be made when particular conditions are studied out.

Blister Mite.

I send leaves of Bartlett pears. What is the trouble with them? The trees were affected last year, one so badly that the blossoms fell without setting. It is yet too early to tell as to whether it will be as bad this year, but practically all the trees are more or less affected.—H. E. C., Hemet.

These leaves are affected with a reddish-brown fungus-appearing spot. It is not, however, a fungus, as is shown by the following answer by Prof. Ralph E. Smith of the Southern California Pathological Laboratory:

"The pear leaves sent by your subscriber are affected by an insect called the blister mite. This is a very minute insect which imbeds itself in the tissue of the leaf, causing the little swellings seen on the under side. It is not often necessary to apply any special treatment for this insect, but where it is likely to be very abundant it is said to be controllable by spraying with whale oil soap or kerosene emulsion previous to its appearance."

Beetles Boring Orange Twigs.

I am sending beetles which infest my orange trees. The point of attack is usually where two limbs join, an excavation being bored vertically into the limb. What is it, and is it going to be a serious pest, and how may I eradicate it? Later notice gum exuding from some of the branches. Also has the yellowed condition of leaves enclosed been caused by this beetle? There are but very few of the beetles on any one tree.—Rancher, Riverside.

This subject was referred to Mr. E. O. Essig, horticultural commissioner of Ventura county, and he writes that he is unable to give any information, the pest being entirely new to him. The subscriber has been asked to for-

ward at once specimens to the department at Washington. The yellow leaves and exuding gum come from other causes, the yellowing especially being due to chlorosis. We hope to give fuller information later.

Later Prof. C. F. Baker of Pomona College writes:

"The beetle you sent is a Polycaon, belonging in the Ptinidae. Fall records three species from Southern California, P. stoutii which is very common here and which Fall found once in numbers under bark of Eucalyptus; P. confertus which has been found boring in grape, and P. megalops which is very rare, and only taken a few times. This which you send does not appear to be stoutii. So it may be confertus, which we do not have in the collection here. You may be sure it is a Polycaon. We will get the species later. This case of boring into the orange is probably not the regular habit of the species—they are likely to bore into anything."

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway. Los Angeles.

Will and Division of Property.

A widower, with children, owning land, marries a widow with children, and makes a will before marriage, giving his wife ten acres and half the eggs and agrees to attend to the chickens, but the will is not recorded. Should he die before the wife what could she claim, or if she should leave him, what would be her property rights?—Subscriber.

The will might be changed or revoked at any time before the husband's death. The wife would be entitled, in the event of his death without a will, to one-half of the community property, that is, of the property acquired during their marriage, and one-third of the husband's separate property, that is, any property that he owned at the time of the marriage, together with such as is accumulation of that property, and any that he has received since marriage by gift, devise or descent. If she should leave her husband she would have the same property rights until the question of property should be settled by the divorce courts or by agreement. In the event of no divorce, or other proceeding to determine her interest, she would get the same as above.—E. L. P.

Unrecorded Deeds.

If a father deeds land to his children and wife in parcels as he wants them to have it, he (the father) holding those deeds in secret until his death, at which time they will, of course, be made public and recorded, is such a procedure legal? Please state the best way to fix landed property so as to keep it out of the courts after the death of the owner.—Subscriber.

The plan suggested might work without causing any trouble. The law regards such deeds as in the nature of wills, and any one interested might compel them to be probated the same as a will. There is no sure way to keep property out of the probate court, except to dispose of it absolutely before death. Of course, many times the probating is avoided by such proceeding as you suggested, but it is not a certain way, and very frequently is not advisable.—E. L. P.

Homesteading by Woman not Divorced.

If a woman is parted from her husband can she homestead here in California without getting a divorce?—Subscriber.

If a woman has been abandoned by her husband and she is the head of a family, she may make a homestead entry.—E. L. P.

Legality of Will.

Is it necessary for the husband to be present when his wife makes a will in his favor, and even does not know of it until after her death? If she leaves use of all her property to him during his lifetime, then to revert to his mother, giving nothing to her own mother or heirs, can her mother or heirs get anything? Is it legal without a witness?—Subscriber.

It is not necessary that the husband be present when the wife makes her will. In this state, a woman can execute legal documents as freely as a man. She can will her property to whomever she pleases, so long as she makes it plain to whom she wants it to go, and can even disinherit her children, if her will plainly indicates that that was her intention. It would be impossible to say whether or not the will is legal without an opportunity to know under what circumstances it was executed. A will may be legal although it is not witnessed, if it is entirely written, dated and signed by the party making it. If it is not so made, it must be witnessed by two witnesses who are requested to witness it by the party making it. The witnesses must sign it in the presence of the testator who declares to them that it is his will, and they must each sign it in the presence of the other and of the testator, and he must sign in the presence of the witnesses.—E. L. P.

Damage from Cutting Dike.

A ridge of land on property caused water to back up on neighboring land. During the recent storms this was backed up until neighbors came and cut a ditch through the ridge which is on our property. The water escaping through this opening cut a deep ravine and seriously injured the crops. Is there a case for damages? We have been injured to the extent of $700.—Subscriber.

You have an action for damages against the parties who cut the dike and let the water out across your land. You have also a right to repair the breach so that the water will not again run over your property. This answer assumes that the ridge on your land is a natural ridge, or if an artificial ridge, that it has been maintained for a sufficient length of time to give you the right to have it remain. Also assumes that the course which the water took is not a natural course along which the lake has been accustomed to drain.—E. L. P.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Eye Inflamed.

A profuse and almost constant flow of watery fluid runs from her (kind of animal not stated) eyes, and, when dried, leaves a white substance which attracts the flies. She has lost the sight in one eye. Do you know of any remedy?—Subscriber, El Centro.

Venturing the presumption that the animal in question is a cow afflicted with inflammation of the front part of the eyeball (probably infectious keratitis), the following remedy is suggested: Iodoform ten grains, calomel ten grains, boric acid one drachm, and finely pulverized sugar half ounce; mix thoroughly and place a pinch in each eye morning and evening.

Seasonable Goods

Of special interest right now, are our Harvesting Machines, Hay Tools and Hay-Presses. We have made it our business to get hold of the best in these lines. We especially call attention to the following:

Deering Ideal Mowers; perfect shear-cut, ball and roller bearing—nothing better made.
Deering Ideal Self-Dump Rakes; with ball bearing wheels; strong, durable—first class in every particular.
Dain Buck Rakes and **Stackers;** scores in use in Southern California. They are built right and will positively carry the teeth off the ground when heavily loaded. Power lift—easy to operate.
Southwick Hay Press;—without question the best horse power press made. Many of our customers have averaged 30 tons per day or better for entire seasons' runs. We also have the Sandwich Engine Power Belt Presses—of wonderful capacity. Smaller Presses, too—all steel, self feed.

See us or write today.

SEED CORN

Department of Agriculture Selection No. 160. An early maturing yellow flint corn that has produced 78 bushels shelled per acre. Will produce a fair crop with a minimum of water if planted early. Sold only in the ear. Price $3.00 per 100 pounds, smaller lots five cents per pound.

J. B. Neff
Anaheim, Cal.

Timely Ranch Suggestions

HINTS IN BEET CULTURE.

The American Beet Sugar Company of Oxnard sent to patrons of the factory a circular with hints in beet culture, from which we quote:

An average of all the measurements taken from the beet fields during the 1910 season shows that the average stand was only 31,487 beets to the acre, whereas the normal or ideal stand is 43,560 beets to the acre.

We beg to submit, therefore, a few short and timely hints, which should be valuable in securing a better stand of beets.

Numerous causes are accountable for this shortage; some of them are unavoidable and produced by the uncontrollable elements, but the majority can be attributed either to the thinning contractor or to the farmer himself.

Preparation of Seed Bed.

The most important point in order to secure a good stand is to thoroughly prepare the seed bed. After the field has been pulverized and harrowed, both in length and crosswise, pack the top soil well for about two to three inches in depth.

If rain is expected soon after planting, do not roll your land, as the rainfall will pack the surface soil sufficiently to insure uniform sprouting of the beet seed. Prepare your land as quickly as possible, and begin planting immediately after it is worked down, in order to avoid drying out of the seed bed, as beet seed requires considerable moisture to produce germination.

Planting.

The next important step in the cultivation of sugar beets is the planting. Early in the season the farmer should thoroughly examine his beet drill to see that it is in perfect working order when planting time arrives.

The time to plant depends upon the season, as well as on the rainfall and the nature of the soil.

Not less than twenty pounds of beet seed to the acre should be planted in order to secure a good and profitable stand under all conditions, because, should dry weather prevail, enough seed will generally germinate to make a satisfactory stand. Furthermore, should a crust be formed on the field after a heavy rain, one plant will help its neighbor to break through the crust. Therefore, sow at least twenty pounds of seed per acre.

We have noted from personal observations that many of the farmers in our district are inclined to plant the seed too deep. Beet seed should never be planted more than three-fourths to one and one-half inches deep, and care should be taken that the soil is well packed around the seed by the press wheels in order to draw the moisture necessary for germination.

The deeper the seed is planted—and especially so in heavy soil—the weaker the plants will be, provided they come up at all; therefore, avoid deep planting.

Thinning.

The next operation is the thinning. We consider this the most delicate and most important; in fact, the one upon which the results of the beet crop largely depend.

The farmer, after having decided upon the distance he wishes his beets to be thinned, should stipulate this distance in the written agreement with his thinning contractor, and he should closely superintend the work in order to satisfy himself that it is being properly performed.

The most favorable distribution of the beets in the field is as follows: If planted in eighteen-inch rows, by thinning them eight inches apart, or, if planted in sixteen-inch rows, by thinning them nine inches apart, which will give in either case a stand of 13,560 beets to the acre.

We, of course, cannot advise or recommend an arbitrary distance between beets, as much depends upon the productiveness of the land, and also on the evenness of the stand.

The average poor stand of the last year was due partly to the fact that the beets came up very unevenly, owing to the irregular distribution of moisture, but it was also due to the careless work of the thinners.

To sum up, we suggest, in order to improve the stand of beets and consequently the gross return of the farmer:

First—To plant at least twenty pounds of beet seed to the acre.

Second—To avoid planting too deep.

Third—To stipulate in the thinning contract the average distance between beets in the row.

Fourth—To carefully supervise the work of the thinners.

DRY LAND GRAIN RAISING.

Dr. G. W. Shaw, of the University of California, who was a delegate to the Trans-Missouri Dry Farming Congress, recently held at Spokane, Wash., at the series of Farmers' Institutes in the San Joaquin valley, took occasion to speak particularly of the work of the congress, and urged the farmers to get into closer touch with the work of that body.

The congress was organized four years ago with a membership of eighty persons. Today it has a membership of about 10,000 persons interested in the study of agricultural practice as related to non-irrigated lands. The membership is not limited to residents of this country, but includes many from foreign countries. At the session just closed, there were present official representatives from France, Russia, Algeria, Chile, Mexico, Australia, Alberta and Saskatchewan.

The fundamental aim of this congress is the reclamation of semi-arid lands of the world, and rendering them productive by scientific soil-culture, seed-breeding, conservation of moisture, and the study of requirements of success in every district of the world.

By recent action, the movement has been made international in character and is destined to have a far-reaching influence. Its reports have already been translated into many languages.

The work of the congress is doubly educational, for its mission is to educate the people and to educate the plants.

Dr. Shaw stated that it was much to be regretted that there was but one delegate present from California because the topics discussed were of such vital interest to those farming non-irrigated lands in this state. California has been following some of

the principles involved for forty years, yet the application of these principles has been quite generally bad, and a wider dissemination of the fundamentals of moisture and soil conservation would result in a material increase of production in the state, especially in the matter of grain production on a more restricted area.

For a number of years Dr. Shaw has been an insistent advocate of certain modifications on culture in grain-growing in California, his ideas having been developed from results obtained upon the experiment stations of the state under his supervision.

His convictions were much strengthened after investigating the work done in the Northwest, along similar lines.

Speaking of the essential modifications of the methods now in vogue among farmers, he states them as follows: First, a deeper preparation of the soil to serve as a greater reservoir for the storage of moisture. The present system has quite generally developed a plow-sole which quite effectually interferes with the penetration of moisture into the lower layers of the soil. This deep plowing is best done in the fall to allow the storage of a larger percentage of moisture.

Second, the maintenance of a clean summer fallow, with a fairly fine soil mulch during the summer.

It is very important for the conservation of moisture that this land be kept free from all weed growth during the summer.

Third, the selection of vigorous, plump seed, which preferably should be graded before planting, using only the larger-sized grains.

Fourth, the seed should invariably be treated with blue-stone or formalin to prevent the growth of smut. At present there is a loss of approximately $1,500,000 per year in the state from a neglect of this precaution alone.

Fifth, a press-wheel drill should be used for seeding instead of broadcasting.

On the stations of the university, the average difference in forty trials of broadcasting, as against drilling, has given a monetary difference of over $6.00 per acre in favor of drill-seeding.

Sixth, the grain should be harrowed after it is up, in the spring, for the sake of moisture conservation.

Seventh, after the crop is removed, the land should be disced by half lapping the disc for the purpose of preventing the loss of the residual moisture, and furnishing a fine material to be turned under at the time of plowing.

Eighth, for replenishing the humus supply and aiding in the permanent conservation of moisture, it is extremely important that, occasionally at least, winter rye should be seeded on the land intended to be summer fallowed at the time of the first rains and the green rye turned under deep at the time of plowing the summer fallow in the early spring. This increases the absorption power of the soil, renders plant food more available and encourages deeper rooting.

By following along these lines of culture systematically, the station has been able to raise the crop from eight or ten bushels obtained on old grain-land as handled by the time-honored, but faulty methods long practiced in California, to over forty-five bushels per acre.

By the improved system of culture advocated, there is no reason why the average yield of wheat in California should not equal or exceed twenty-five bushels per acre, instead of thirteen bushels, which is not the average yield.

COBURN'S BOOK.

Reference can hardly be made to Kansas agriculture without speaking of that veteran in agriculture in that state, Mr. F. D. Coburn. He has been at the head of the state board of agriculture and is reported as having twice declined the U. S. senatorship that he might remain with the industry which he loves. He has just issued the 17th biennial report, a book larger than the Department Year Book, and filled with matter of greatest value to all farmers and especially to those of the Northwest. It is full of engravings and put up in such shape that it would make an admirable pattern for our California state board of agriculture.

MAKE MORE OF THE SOCIAL LIFE.

A writer in The Grange in speaking of the true Grange ideal says: "The true Grange ideal expects its membership to be benefited socially as well as along other lines, so the lecturer who fails to provide some entertainment and social diversion fails as a successful lecturer. The serious business of the Grange is most vital, yet if we fail to make the farm and the Grange sufficiently interesting and attractive to hold the boys and girls of what avail are our labors."

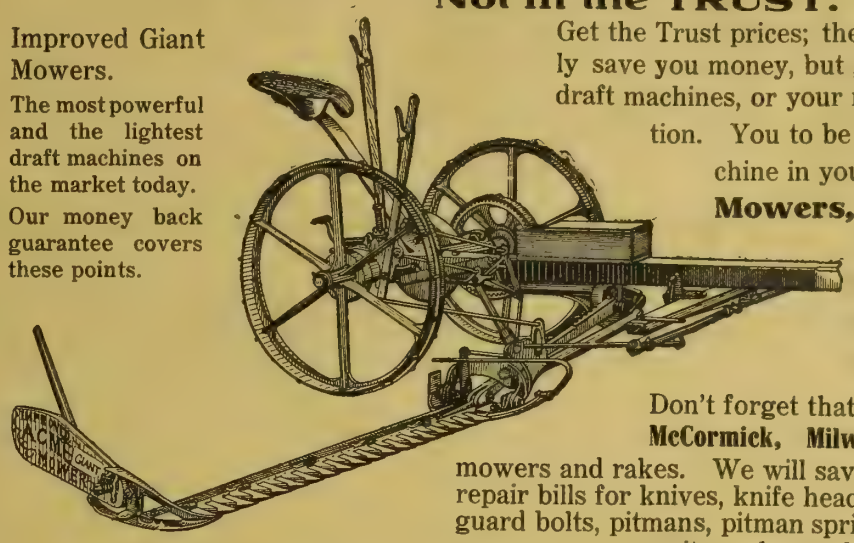
No farmer's duty ends when he provides his family with the best facilities and the best livelihood possible to his means. For he must then consider his duty to his community, and in so doing he must realize the truth of the Biblical saying that "no man liveth unto himself and no man dieth unto himself." That means that no matter how hard we try we can't get away from each other and that if we strive to do so the penalty is stagnation for ourselves and those around us. The principle of co-operation began with the Garden of Eden and it is still on the job.—Chas. S. Barret in The Grange.

INDEPENDENT ACME
Not in the TRUST.

Improved Giant Mowers.

The most powerful and the lightest draft machines on the market today.

Our money back guarantee covers these points.



Get the Trust prices; then come to us and we will not only save you money, but guarantee you better and lighter draft machines, or your money refunded without a question. You to be the judge after you test the machine in your field.

Mowers, Rakes, Sweep rakes, Stackers and Binders.

We pay the freight. Write at once for catalog, prices and testimonials.

Largest stock of repairs on the coast.

Don't forget that we carry repairs for the **Acme, McCormick, Milwaukee** and all other makes of mowers and rakes. We will save you from 25% to 50% on your repair bills for knives, knife heads, sections, guards, guard plates, guard bolts, pitmans, pitman springs, pitman straps, pitman bolts, pitman boxes, knife clips, wearing plates, rivets, rake teeth and chain.

Send in your orders and ask for price list.

Acme self dump rakes. 8. 10, and 12 foot. Better than the rest and much lower priced.

LIVE STOCK.

Stallions for Sale—Acclimated animals. All harness broken, sound and gentle. Leader 40637. Dapple gray, 8 yrs. old. Ladoga Leon 66619, 2 years old. Dark gray, Dam weighs a ton. Liberty 74310 Black yearling. These three are registered in the Percheron Society of America. Atwood, bay carriage stallion, 2 yrs. old Solid color. Sired by Athadon, 1st dam by Junio, son of Electioneer. McKinney Don, 2 yrs. old. Solid bay with black points. Sire Stanford McKinney. 1st dam Belladonna, standard by trotting record. 2nd dam by Athaneer. Both well broken to buggy. Minnewawa Stock Farm, Fresno, Cal.

For Sale—Fine young Jersey bull, dropped August 6, 1909; sires St. Lambert of Ramona, 62633; dam Comma of Ramona, 202577. Solid color and an animal perfect in every particular. This splendid combination of St. Lambert and Pedro stock means a sire fit to head the best thoroughbred herd. See or address W. E. Vallentine, Sterling Milk Co., R. F. D., Corona, Cal.

Dairy Floating Thermometers and all kinds of supplies for the dairy at Guy F. Kelsey Co., 108 E. 8th St., Los Angeles. Phone Sunset Main 7496.

For Sale—Registered Yorkshire Boars. The Yorkshire is the greatest bacon hog in the world. Address Joe M. Regan, De Luz, San Diego Co., Cal.

For Sale—Shorthorn bulls and Berkshire hogs. Bred for size and quality. H. L. Murphy, Perkins, Cal.

Saanen Milk Goats for sale. Fred Hansen, Carpinteria, Cal.

WANTED.

Local Representative Wanted—Splendid income assured right man to act as our representative after learning our business thoroughly by mail. Former experience unnecessary. All we require is honesty, ability, ambition and willingness to learn a lucrative business. No soliciting or traveling. This is an exceptional opportunity for a man in your section to get into a big paying business without capital and become independent for life. Write at once for full particulars. Address E. R. Marden, Pres. National Co-operative Real Estate Co., L443 Marden Bldg., Washington, D. C.

Wanted—To rent to a reliable dairyman, an alfalfa ranch of 150 acres; 125 acres in alfalfa, balance pasture; fenced and cross-fenced. New buildings. Abundance of water, both ditch and pump. 7 miles west of Porterville, 1½ miles to creamery, church, school and blacksmith. Will rent for a term of years either for cash or on shares. References required. E. A. Marshall, R. F. D. 1, Box 90, Porterville, Cal.

Wanted—Your work pays the expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. United Trade School Contracting Company, 647 Pacific Electric Bldg., Los Angeles, Cal.

Creamery Manager wanted for modern creamery, in operation one year. Opportunity for investment if desired. Address M, c|o Cultivator.

Bee Men Wanted—One man to run apiary, in hills between Pomona and Fullerton, on shares. Another man to care for apiary by the month, current wages, on ranch, Kern county. Employment all the year. Address Palm Fruit Co., Wasco, Kern Co., Cal.

Farms Wanted—Don't pay commissions. We find you direct buyer. Write, describing property, naming lowest price. We help buycrs locate desirable properties free. American Investment Association, 12 Palace, Minneapolis, Minn.

MACHINERY.

For Sale—Second-hand windmills, gasoline and steam engines, pumping outfits. Wagons, buggies, harness, disc, gang, walking, riding and side hill plowers; slip, Fresno and wheel scrapers; header, baler, seed sower, spike tooth and disc harrow, mowers, rake, fanning mill, dry washer, disc cultivator, reaper, blower, anvil, eveners; road grader, road roller, Hurst two-horse sprayer, mining hoist, sundries.

WINDMILL OUTFITS.

8 ft. steel Star, tower, tank, tank house, pump complete, $39.00, or $42.50 on cars; 10 ft. steel Aermotor, steel tower, 3000 R.W. tank, 20 ft. stand, 100 ft. 2-inch galv. pipe at ½ new price; also many others. Several gasoline pumping plants.

TANKS, TANKS, TANKS.

50 gallons to 50,000. Special price on 25,000, 30,000 and 50,000 gallon; 15,000 on 20-ft. stand, 5,000 and tank house.

LINERS DO THE WORK.

Pattiway, Cal., March 4, 1911.

Cultivator Co.,

Dear Sirs: Please stop my ad. In a hurry and send me bill. I've received enough inquiries in one mail through my ad. in your paper to sell this whole country. Your paper is surely **IT** when it comes to getting results. I will send you another ad. soon. Yours respectfully,

WM. T. MANTZ.

ONE OF OUR LINER ADVERTISERS.

San Luis Obispo, Cal., April 2nd, 1911.

California Cultivator,
Los Angeles.

Sirs: Enclosed herewith please find check for $——, which will pay for the insertion from Feb. 9th to May 11th. Kindly notify me at that time as I may wish to continue the liner. I have received many orders through your medium and especially for eggs of my Blue Andalusians. At times even more than I could supply. I am very well pleased with the results of the advertisement.

Yours very truly,
MRS. A. V. COX.

Mammoth Pekin Duck Eggs, $1.00 per dozen, $6 per 100, Select White Leghorn eggs, $3.50 per 100. Clough, 3826 Peralta Ave., Dimond, Fruitvale P. O., Cal.

POULTRY

1889-1911—Barred Plymouth Rocks, Ocean Blue Strain. Birds of our breeding made a phenomenal record in the hands of our customers this season. Won first place at five of the largest Coast shows, besides many shape and color specials. Fourteen silver loving cups were won by this strain. We won in every class at the big Los Angeles Show—something no other exhibitor of Barred Plymouth Rocks can claim. Every female in pullet pen for this season is a winner either in pens or singles. Every male heading cockerel mated pens this season is a winner either singly or in pens. We are ready now for your egg orders. Same old price—$3 and $5. Mr. and Mrs. D. T. Wieland, Moneta, Cal. Take Redondo car via Moneta avenue. Get off at Illinois street, right on ranch.

White Orpington and White Wyandotte eggs for hatching. My winnings at Los Angeles 1911 were 1st cock, 1st hen, 1st and 2nd cockerel and 1st pullet on White Wyandottes. White Orpingtons, 1st, 3rd, 4th and 5th pullets, and 2nd and 4th hens. I breed my winners and am up to date in mating for results. I have no other business. Eggs sell at $3.00 and $5.00 per 15. No more stock until May 15th, when I will sell part of my breeders. Order direct from this ad and your order will receive my most careful attention. A. W. Huskins, 713 Waterloo St., Los Angeles, Cal.

Eggs from selected, trapnested stock. White Minorcas, beauties, layers of large white eggs, eggs $3.00 per 36. White Wyandottes, great winter layers. White Plymouth Rocks, Fishel's strain, prize winners, eggs from both $2.50 per 36, $6.00 per 100. White and Brown Leghorns, very select stock, $2.25 per 36, $4.50 per 100. Pearl Guineas, $2.00 per 15. Bronze Turkeys, 20c each; none better. I have about 500 per week of day-old White Rock chicks, Fishel's strain, for sale, $15 per 100, 17½c for less quantity. W. D. Rose, R. D. 6, Santa Ana, Cal.

Jubilee Orpingtons—Just received from Wm. H. Cook, England, a pen of Jubilee Orpingtons. Will have only a limited number of settings for sale. These are the best that England can produce. F. S. Washburn, Direct Importer, 240 Anita Street, San Jose, Cal.

Overcrowded; will sacrifice a few splendid White Rock roosters, 20 months old, fine breeders, $5.00 apiece while they last; also 6 hens, 20 months old, for $10.00. Write Dr. T. J. DeVaughn, 30 N. First St., Alhambra, Cal.

White Wyandotte Eggs for Sale—From good strong, large, vigorous stock. My birds are pure white and typical Wyandotte shape. Price per setting of 15, $2.00; per 100, $9.00. All eggs carefully packed for shipment. M. B. Patton, 1124 Brent Ave., So. Pasadena, Cal.

Rose Comb Black Minorca eggs and chicks from the largest and best mated flock in California. Eight-year line bred to pay and win. Free circular tells all about them. Eleanore Minorca Farm, Route 1, Los Angeles, Cal.

S. C. Brown Leghorn Baby Chicks, May 8th, $7.50 per 50 or $15 per 100. Mrs C. H. Vary, Pomona, Cal.

FARM LANDS FOR SALE.

Owens Valley offers to the farmer unusual opportunities for diversified farming. With the elevation of 4,000 feet, no fogs, abundance of mountain water running by gravity, a disintegrated granite soil, having been washed from the mountains for centuries, a growing condition is created, the results of which are almost unbelievable.

Alfalfa, as high as four tons to the cutting; timothy with 10-inch heads; from 350 to 500 bushels of potatoes to the acre; as fine Spitzenberg and Winesap apples as grow in Washington and Oregon; a hog, cattle and poultry country that we believe is superior to anything in the State, and, on top of this, the most delightful climate and wonderful scenery.

Surely any farmer figuring on making a change should at least investigate Owens Valley before deciding. Buying a farm is buying a home, and it may be that you will spend the rest of your days on the next farm you buy. Certainly it is worth very serious thought. We want to mail you booklets and pictures, which will tell you a complete story of Owens Valley. The James R. H. Wagner Co., 329 S. Hill St., Los Angeles. Room 10.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

Dairy Ranch For Sale—160 acres in San Joaquin Valley; 7-room house, stable, fenced and cross-fenced. Plenty of flowing water to irrigate the 160 acres. 80 acres in alfalfa, balance alfalfa land 12 miles from R. R. Good roads. $100 per acre, ½ cash. Will also sell the cows if desired. Inquire of Geo. W. Berry, of Berry's Market, Whittier, Cal.

For Sale or Trade—230 acres Oregon land in the famous "Rogue River Valley;" fine fruit land, 40 acres cleared, balance in timber; located ten miles from Central Point. A good two-story farm house, large barn. Fenced with 17-wire "Page Fence." Schoolhouse on corner. Would exchange for Los Angeles country or city property, to value of $8,000 or $10,000. Price $65 per acre. Address J. H. Grace, Central Point, Ore. P. O. Box 203.

20 Acres, adjoining the Roeding and Wood Nursery land, 1½ miles S.E. of Exeter; best of soil, good location; fine for oranges or lemons. Pumping water at shallow depth, road on both sides, high school. Price $175 per acre, $2000 cash, balance 2 and 3 years, interest 7 per cent net. Fred M. Hart, Exeter, Cal.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

For Sale—Orange land in small tracts in Exeter district. Large tract of level, fenced, pasture land. Plenty water. Part cash, terms. Apply Fred M. Hart, Exeter, Cal.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—Fine alfalfa ranch, ½ mile from R.R. station, 86 acres, abundance of water. Only $300 per acre. $10,000 cash will handle this. Would consider a trade for good income property in Los Angeles. John W. Shepardson, 215 Katz Bldg., San Bernardino, Cal.

Pacific Coast Lands—Farm lands appraised for prospective investors. Reports on agricultural projects, soils, irrigation, drainage, etc. Paul Goodloe, 1049 Phelan Bldg., San Francisco, Cal.

TURKEYS.

White Holland Turkey eggs and poults. Two pens headed by magnificent, heavy toms, correctly mated with beautiful hens. Eggs $3.50 per setting. Poults 50c. Bronze Turkey eggs $2.00 and $2.50 per setting. Poults 50c. Richard Eble, Casa Verdugo, Cal. Sunset Glendale 164 J. Rhode Island Red and White Leghorn eggs and baby chicks.

White Holland Turkey Eggs from large, vigorous stock, 35c each. Poults, May 16th, 50c each. Also gobblers, $7.00. Mrs. Hocking, Guasti, Cal. Winner of 1st prize, Los Angeles, 1911.

For Sale—Thoroughbred Mammoth Bronze Turkey hens of large size and fine markings. Also eggs for hatching. Mrs. Nellie Hart, Holtville, Cal.

Mammoth White Holland Turkey eggs, $3.00 per dozen. R. L. Warren, National City, Cal., R. D. 1.

Mammoth White Holland Turkey Eggs, $5.00 per 13. No better stock anywhere. A. H. Blakely, Ontario, Cal.

RARE PLANTS.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

Ahuacates, Alligator Pears (Persea Gratissima). Fresh Mexican seeds, none better for stock; $4.50 per 100 seeds; $40.00 per 1000 seeds. Montarioso Nursery, Box 1500, Santa Barbara, Cal.

Ferns for growing on Adiantum pedatum 5c, Pteris serrulata 3c, Aspidium tsusimense 3½c and 5c. Terms cash. Ballou's Nursery, Pasadena, Cal.

Agricultural Implements—Vehicles.

A personal call will show you that we have the best and largest stock in the southwest. We are now doing the largest wholesale business and intend to build up our new retail department. Arnott & Co., established 1892, 112-118 South Los Angeles St., Los Angeles.

For Sale—One 5-passenger Winton auto, extra tires and inner tubes. Also one autocar runabout, fully equipped. M. Jacobs, 201 Howard St., San Francisco, Cal.

Business

BUYING WRONG AND BUYING RIGHT.

Nearly all tools look attractive in a show case. Their polish, their newness and their glitter attract the man who looks at them, and make him want to use them.

He stops, handles them, buys a few pieces and carries them to his shop or his home. He thinks of them as "just tools," and the initials stamped on the blade of a draw knife may mean a reliable concern as the maker or it may mean some obscure firm that has no responsibility.

A child can be safely sent for a tool and get the same quality his father would get. The Keen Kutter trade mark shows him that he is getting the right brand and that there can be no mistake. No knowledge of tools or of steel is required. Every Keen Kutter tool is like its mate, in quality.

A workman or a farmer equipped with a set of Keen Kutter tools is sure of having the best he can get anywhere at any price.

Even if Keen Kutter tools cost a very little more than you would pay for ordinary tools of unknown worth, you will get the difference in quality and service, and you will be sure that every piece is dependable and equal to any emergency.

The best way is to buy a Keen Kutter cabinet, fitted with the tools you need. The price for these cabinets range from $8.50 for the household size, to $125 for the carpenter's or cabinet maker's, complete equipment with a work bench and vises included.

Your hardware dealer has both Keen Kutter tools and cabinets, no doubt; but if he hasn't, he will gladly order them for you if you so request him. If not, write to the Simmons Hardware Company, St. Louis, Mo.

FARM OWNERS NUMBER.

The Thomas B. Jefferey Company of Kenosha, Wisconsin, will send on request its "Farm Owners Number." It is magnificently printed and filled with illustrations of Ramblers in many interesting sections, and of parts of the great works which produce the Rambler automobile. A careful consideration of the article entitled "Which Car for the Farm," commencing on page 611, and also the article entitled "The Woman and the Car," on page 613, we believe will prove interesting, especially to farmers who are trying to decide the kind of a car they would purchase. It is well worth the asking.

If looks as if Uncle Sam is winning another commercial race. This time the field of activity in which he is making the running is the manufacture of fabric for aeroplane wings; and it is through the success of the Goodyear Tire & Rubber Company at Akron, O., that the good old eagle is soaring higher and faster and safer than foreign rivals in the realm of aviation.

Aeroplanes equipped with wings or planes of Goodyear rubberized fabric are being used by the United States army, which has tested many "treated" cloths and mercerized silk. Several fabrics are reported to have been found satisfactory under certain favorable conditions, but a contraction and expansion of one inch in every eighteen inches was recorded for the mercerized silk fabric, which is regarded as vitally significant upon a perfect and reliable equipment that will neither stretch nor tighten and is impervious to the effects of heat, cold or moisture.

One of the biggest supply houses on the Pacific Coast catering to irrigators is the Smith-Booth-Usher Company of Los Angeles. This concern recently constructed at a cost of $100,000 a building with a floor area of 100,000 square feet, one-half of this being ground floor space. One of the features of the building is its loading facilities, enabling goods to go in and out at the same time. The switching track extends the entire length of the building, which is located at 228-238 Central avenue, and is for storage and manufacturing; it does not take the place of the salesroom on South Los Angeles street.

That best portion of a good man's life—
His little, nameless, unremembered acts
Of kindness and of love.—Wordsworth.

General Household Notes

APRIL DAYS.

When April days go dancing,
Along the road to May;
With here a flower and there a shower,
And never time to stay,

Then brooks are full of little waves,
That race and chase in glee,
And all the flooding rivers
Rush on to find the sea.

Then spring the brave green grasses
On every hill and plain,
A mighty host, in field and coast,
They laugh in sun and rain.

Then mornings wake in melody,
And mirth finds time to stay,
When April days go dancing
Along the road to May.

THE WIDOW CRAIGIN.

The narrow street was cleared and the ambulance had driven off, when John Moreland, completely unnerved and crying like a baby started up his car at the ring of the pallid faced conductor.

"It was the kid I've watched all summer," John sobbed. "She was the prettiest little thing you ever saw. I couldn't help it, officer. I worked as quick as I could, but she started like lightning to run across when the boy grabbed her kitten."

"Don't take it so hard," said the policeman, whose duty it is to go with the motorman to the end of his route. "Stop talking and run your car.' '

But John's nervous excitement had to find outlet in words.

"She used to have an eye out for me perched up there on her doorstep. I've grown that fond of her, and now —oh, Lord! I couldn't look. Do you think she was injured bad, officer?"

Half crazed with grief, talking to himself and to the officer by turns, John Moreland, kind hearted John, who wouldn't hurt a fly, ran his car to the barn and was laid off pending investigation of the accident that sent the Widow Craigin's only child to the hospital and caused heated discussion among the neighbors.

"It's like flying in the face of providence, Mrs. Craigin, not to sue," said one. "You can get damages enough from the road to live at ease for the rest of your life."

"We will all stand by you, Mrs. Craigin," said another. "The motorman was careless, fast enough. There's plenty that saw him and had their names and addresses taken that can tell the court that much."

"Indeed, they cannot and speak the truth," flashed back the Widow Craigin. "I was standing by the window and saw the whole thing myself. No human being could have saved the child, she darted that sudden. When the gentleman from the railroad office came to see me I told him fair and square they hadn't a more careful motorman on the road. There's nobody to make trouble but myself, and I'll sue for no money that wrongfully may put a man out of his job."

This in due time reaching the ears of John Moreland, strengthened his resolution to call on the mother and hear from the "little kid." One afternoon he started out, but courage failed him when he reached the house. As he stood irresolute the door opened and a pale little woman came quickly down the steps.

"John!"

"Mary!"

John started, almost speechless, then blurted in his embarrassment:

"A little girl was hurt—her mother I want—which floor might it be?"

"I am the little girl's mother, John."

The man staggered. His words came disjointly.

Not your child! Oh, Mary, that trouble should come to you through an act of mine. They say you spoke up for me, too. It's not to be expected you can ever forgive—"

"There's nothing to forgive," put in the Widow Craigin, quickly, "and I'm not the woman to do you a mean turn the second time. I've had cause enough to repent the way I treated you eight years ago, and if there is to be any forgiving, it's not—"

"Stop that," interrupted John, almost roughly. "Tell me about yourself. Is it here you live?"

"Yes. Since my husband died I've had the front room at the top and done sewing. It has been hard work keeping myself and the child. There was so little I could do for her the hot summer days, that when I saw you on the route three months ago I got her interested in watching for your car. When it was time for you she must always have her curls brushed and her face clean 'for her motorman,' as she said."

"But you, Mary—"

"I used to watch, too," said Mary, with a faint blush. "That is how I saw just what happened. It's visiting day at the hospital," she added, quickly changing the subject. "I'm on my way there now. Won't you come with me? The child is nearly well."

"Doesn't she hate me?" began John, his voice trembling with anxiety.

"That she does not. She has asked for her motorman most every day since she went in.

John, a great load lifted from his mind, started down the street beside the Widow Craigin.

"Look here, Mary," he said at length. "You are the only woman I ever cared for. I've lived straight and saved my money. I want you to marry me, and I'll take care of you and the child. Tomorrow they put me on another route that runs into the country. Somewhere we will find a tidy place with a bit of grass and a flower or two for the 'kid.' What do you say, Mary?"

There was a few minutes' silence, then:

"I say yes, most thankfully," answered Mary.

So together they walked on down the street, straight toward brighter days for the 'kid' in the hospital and for John and Mary.—Boston Post.

THE RESTORATION OF RAMONA'S MARRIAGE PLACE.

The historic marriage place of Ramona, heroine of the literary classic of the Southwest, has recently been restored. This link between the real and the storied romance of Southern California's early days is situated in the old Mexican village of "Old Town," the original San Diego. Lying just north of the present busy little city of San Diego, teeming with bustling anticipation of exposition, and railway and canal, its sleepy, half-ruined predecessor is well-nigh forgotten.

Yet not entirely so, for in the house of the priest Gaspara, which was chosen as the typical setting for one

Mayer SPECIAL MERIT SCHOOL SHOES

These shoes are built exceedingly strong. The leather is tough and the soles are selected from the best wear-resisting hides. They are the only school shoes made with two layers of leather over the tip.

"WEAR LIKE IRON"

MAYER SPECIAL MERIT SCHOOL SHOES

outlast average school shoes two to one and cost no more. They are good looking shoes, built to fit and comfortable to wear.

The Genuine Special Merit School Shoes have the Mayer Trade Mark stamped on the sole.

FREE—Send us the name of a dealer who does not handle Special Merit School Shoes, and we will send you free, postpaid, a handsome picture of George Washington, size 15x20.

We also make *Honorbilt* Shoes for men, *Leading Lady* Shoes, *Martha Washington* Comfort Shoes, *Yerma* Cushion Shoes and *Mayer Work* Shoes.

of the most touching of the scenes in the tale of "Ramona," is now to be perpetuated the characteristic surroundings and pastoral life of the old Spanish grants.

The restoration was carried out under the direction of careful students of old Spanish and Mission architecture, and the building is practically a replica of the old construction. An example of the care taken toward this end is in the fact that only Mexican workmen were employed, as the American artisan is too exact in his work, and so the graceful curve and outline of wall and tiling which constitute the chief charm of the old adobe structure might have been lost. The adobe used in the construction is the native soil surrounding the building, and probably much is of the original material used in the crumbling walls.

The main building is practically unaltered, except for repairing the roof, and from this main building are now extended two wings, thus forming three sides of a square, enclosing the patio, a distinctive feature of this form of architecture. This is surrounded by a wide piazza, and paths lead to a fountain in the center. At the end of the wings and traversing the patio is a wide court, enclosed in an adobe wall, running out from the wings to form a complete enclosure. Here are to be the orchard and kitchen gardens, orange, olive, fig, pomegranate and almond trees intermingling with native and Mexican shrubbery.—D. E. Kessler, in Pacific Monthly.

DOROTHY'S BIRTHDAY GUESTS.

Dorothy was to have a birthday party, and had been promised that she could make out the list of guests herself.

Dorothy called in her very best friend, Caroline, to help her, and the two, with paper and pencil, devoted at least an hour to deciding who should be the ones favored with invitations. when the list was completed it was brought to the smiling mother for approval. Her eyes opened with astonishment, for it was about a yard long consisting of pieces of paper pasted together.

"Why, child!" she exclaimed, "what have you here?"

"Only five hundred names," said Dorothy, "and at the ball I read about in the paper the other day there were six hundred people. I guess I want to be as fashionable as other people."

The mother ran her eyes over the list. In included all Dorothy's play mates and most of her acquaintances, and then followed a list of such names as Ali Baba, Haroun Alraschid and the like.

"Where in the world did you get tnese names?" inquired the mother. "Who are these people?"

"Oh, I got them out of the 'Arabian Nights,'" said Dorothy. "But you don't need to be afraid. I don't believe mor'n half of 'em will come."

"Ah, yes, I remember now," said the mother. "I thought those names sounded familiar. Go on and invite them."

And then she added meditatively, with a look back into her own youth: "I wish they would come—all of them."

The following is supposed to be the latest conundrum: Why is a hand-organ like the setting sun? Because the Dago's with it.

Prospective Purchaser: "Is this mule fast?" Owner: "No, not entirely—his hind legs are loose."

DON'T THROW AWAY.

A tablespoonful of tomato. It will flavor the soup.

A tablespoonful of cooked rice. Use it in soup or custard.

A tablespoonful of lemon juice. It is nice in pudding sauce.

A tablespoonful of orange juice. Use it in a dressing for fruit salad.

A tablespoonful of oysters. Chop fine, and mix in your Hamburg steak.

A tablespoonful of jelly. Place in the bottom of a glass, and fill the glass with junket.

A tablespoonful of ginger syrup. Stir into a sugar sauce, and serve with apples cooked whole.

A tablespoonful of sausage meat. Add to stuffing for a beef heart. It accents the seasoning.

A tablespoonful of jam. Put in a small scooped-mold of rice, and the extent to which it adds in taste and appearance will surprise you.

A tablespoonful of cream cheese. Soften, if necessary, with a bit of butter, add a dash of paprika, roll into two small balls. Press a walnut meat on each side, and serve with a salad. —Table Talk.

RECIPES.

Ham Toast.

Remove the fat from some slices of cold boiled ham, chop fine. Put 2 tablespoons butter into a saucepan on the stove, add the chopped ham and ½ teacup sweet cream. Season with salt and pepper, and when hot, remove from the stove and stir in quickly 3 beaten eggs. Pour the mixture over thin slices of toast and serve at once.

Curing Dried Beef.

A tested recipe for curing dried beef is as follows: For every 20 pounds of beef mix thoroughly 1 pound fine salt, 1 teaspoon saltpeter and 1 pound brown sugar. Divide this into three equal parts and rub well into the beef on three successive days. Let it lie in the brine it makes, turning over every day. In a week it is ready to hang up. Hang it in a dry place, only until it is through dripping, then remove to a cool place, if possible. The cellarway will answer if nothing better is available. It molds on the outside in warm weather, but is easily trimmed off and the inside is just right. On the approach of spring put a close muslin paper bag over it.

English Walnut Cake.

The average nut cake is too dry, unless an extravagant amount of butter is used; but the following receipt will be found agreeably moist: Cream one cup of sugar and one-half cup of butter together, add two eggs and a half cup of milk, two cups of flour and one large teaspoonful of baking powder. Have ready a large cup of English walnuts chopped, not too finely, and a cup of raisins stoned. These should be well floured before adding, to prevent their sinking to the bottom. A little grated nutmeg may be used if desired.

Grapefruit.

Cut a grapefruit in half and remove the pulp. Mix the pulp with an equal quantity of celery and chop fine. Chill the fruit cavity thoroughly and fill with this mixture just before serving. Serve on a bed of violet leaves with a few blossoms tucked here and there.—Harper's Bazaar.

SCALLOPED APPLES.

Put a layer of pared sliced apples in the bottom of a buttered pudding dish and dust with a tablespoonful of sugar, a teaspoonful of flour, a sprinkling of cinnamon and a few bits of

Figure on Painting This Spring

A second short flax crop keeps linseed oil up, but the increase in price in pure white lead paint is not so great as you may fear.

Get at your dealer's the cost of 100 pounds of "*Dutch Boy Painter*" White Lead, 4 gals. pure linseed oil, 1 gal. turpentine, 1 pint turpentine drier—this makes 8 gallons of old-fashioned paint.

Compare this cost, either by the gallon or by the job, with what you used to pay for paint.

You'll find the difference so small that you can't afford to put off painting, or to paint with anything except "Dutch Boy Painter" White Lead. Write for free "Painting Helps No. 1426

butter. Fill the dish in this manner, cover tightly and bake for an hour. Serve hot or cold, with cream. It may be covered with a sheet of thin pastry, if one wishes, and when reversed and toped off with whipped cream, makes a handsome and acceptable dessert.

USES FOR SALT.

A little salt stirred into whitewash makes it stick better.

Used as a toothpowder salt whitens the teeth and hardens the gums.

Salt will relieve a cold in the head if snuffed through the nose.

A teaspoonful of salt in a glass of hot water will relieve a sore throat if used as a gargle.

Wash your matting with tepid water, a cupful of salt to the bucket, once a month, and your carpet will last twice as long.

Sage tea with a little salt added is the best of hair tonics.

To remove iron rust from cloth put layer of salt on rusted parts, soak with lemon juice and place in sun to dry.

Coarse salt sprinkled in path or road will prevent weeds or grass growing.

When suffering from neuralgia put salt in a small bag, heat it well, and apply where the pain is centered.—Spokesman Review.

PAST HELP.

The man with the old clock under his arm laid it on the jeweler's showcase. "I wish you'd see what is the matter with this," he said.

The jeweler removed the dial, screwed his eyeglass into place and inspected the works of the ancient timepiece.

"Nothing is the matter with it—now; its sufferings are over."

"Well, how much do I owe you?" asked the man.

"Nothing," answered the jeweler. "This isn't a professional treatment. This is a Coroner's inquest."—Youth's Companion.

A MENDING DEVICE.

When a rip or tear appears in a dress do not patch or sew together, but use the following hint, which is a very good one: Cut a piece of mending tissue the size of the rip or tear, also a piece of material to match the garment, of the same size. Place the garment on the wrong side and over the rip or tear place first the piece of material, then the mending tissue and press with a hot iron.

THE CITY BOY.

God help the boy who never sees
The butterflies, the birds, the bees,
Nor hears the music of the breeze
When zephyrs soft are blowing;
Who cannot in sweet comfort lie
Where clover blooms are thick and high,
And hear the gentle murmur nigh
Of brooklets softly flowing.

God help the boy who does not know
Where all the woodland berries grow;
Who never sees the forest glow
When leaves are red and yellow;
Whose childish feet can never stray
Where Nature doth her charms display
For such a hapless boy, I say,
God help the little fellow!

From infancy children should be taught that older people can often eat things which are quite unwholesome for children, lighter desserts or fruits may be substituted for the rich pastry or pudding and a lesson in self-control be presented.

Teacher: "Why do comedies always end with a marriage?" Pupil: "Because that is where the tragedy begins."—Figaro.

LACK OF RAIN DOESN'T WORRY THESE FARMERS

Last year several hundred farmers decided that they had worried just about long enough over lack of water. So they bought I H C Gasoline Engines and installed irrigation systems of their own.

Now they have the most practical kind of crop insurance and they are independent of the irrigating companies.

Nearly every farm has a creek, slough, pond, or some other source of water supply that can be turned into a valuable asset by the installation of an

I H C Gasoline Engine

Why not put yourself in a position to have water where and when you want it—irrigate your entire farm if need be?

I H C Engines are admittedly the best power for this purpose. They require but little attention and their superior efficiency and economy have been proven by years of service. In addition to running your irrigating system they will do a host of other things such as running a cider press, alfalfa cutter, feed grinder, saw, washing machine, cream separator, etc., better and cheaper than any other power. There are all styles and sizes to choose from, 1 to 45-H. P., horizontal or vertical—stationary, portable, or traction.

Call on the I H C local dealer and let him show you the one best adapted to your needs; if you prefer, write direct for the I H C Engine catalogue.

I H C Service Bureau

What is it? A clearing house of agricultural data.
What does it do? Helps farmers to help themselves.
How can it be used? By sending your farm problems and puzzling questions to the Bureau.
We are co-operating with the highest agricultural authorities and every source of information will be made available to help solve your difficulties. We shall be pleased to have an opportunity to assist you. Write the I H C Service Bureau

Dried Fruits.

FRUITS—1910 crop, f. o. b., carload lots, per lb.—Apples, 11½@13c; Apricots, 10½@13c; do, Moorparks, 14c; Peaches, 6@7½c, with a premium o ⅛@¼c on Muirs; Prunes, bulk basis, 9¾@10c; Figs, 1911, 4@5¼c for White, and nominal for Black; Pears, 9¾@13c.

RAISINS—1910 crop: London Layers, in 20-lb. boxes—3-crown layers, $1.10; do, 2-crown, $1. Seeded, per pkg.—Fancy, No. 16, 6@6¼c; Choice, No. 16, 5⅞c. Loose Muscatels, in 50-lb. boxes—Standard, 4-crown, 5c; do, 3-crown, 4¾c; do, 2-crown, 4½c. Dried Grapes, 2¾c. Seedless—Muscatels, 4@4⅛c; Sultanas, 4¾@5c; Thompsons, 5¼@5½c.

Nuts.

Walnuts, No. 1 soft shell	16@16½
Walnuts, No. 1 hard shell	14½
Almonds, '10 N P U	13½
Almonds, '10 Nonp	15¼
Almonds, '10 I X L	14¼
Almonds, Peerless	13
Pecans	14@17
Chestnuts, California	6@8

Beans, Dried.

Limas	6.25@6.35
Pink	5.35@5.55
Black eyes	6.50@6.75
Small white	3.40@3.50
Large white	3.40@3.45
Kidneys	6.25
Garbanzos	2.75@3.00
Bayou	4.60@4.75
Horse beans	2.50@2.70
Red Mexicans	5.25@5.40
Cranberry	4.50@4.75

Hops.

Hops, coast, 1910	19@22
Hops, 1911 contracts	14@16
Hops, 1909	14@17
Hops, Oregon	14@17

Honey.

Water white comb, '10	15
Dark comb	12½
Extracted white	8
Extracted dark	6½
Beeswax, lb	24@30

Hay.

Scott, Magner and Miller say:

Arrivals of hay for the past week were 3,597 tons, as against 2,427 tons the preceding week. This shows quite an increase, and to our mind accounts for the dullness in the market for the past week. A large proportion of the hay received has been of an excellent quality, and this grade has shown considerable weakness. We believe had a little more judgment been used in making shipments to this market during the week, and receipts held at about the same figures as last week, the market would have improved rather than becoming easier as it has done.

Reports from country districts regarding the new crop are not as encouraging as they were last week, although we believe we will have a normal crop of hay throughout the state. Export trade has been fair during the week, two steamers having sailed for Hawaii which have taken considerable hay and barley.

Alfalfa has been in large supply, and is weak, owing to so much grass being available.

We quote the wholesale prices in round lots on today's market, as follows:

Fancy wheat	13.00@13.50
No. 1 wheat or wh and oat	10.00@11.00
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.00@11.00
Other tame oat	7.50@9.50
Wild oat	7.00@9.00
Stock hay	5.00@6.50
Alfalfa, ton	9.00@10.50
Straw	40@50

Grain.

Barley, fancy	1.50
Barley, good to choice	1.47½@1.48¾
Barley, poor to fair	1.40@1.45
Oats, white	1.50@1.60
Rye, new crop	1.35@1.42½
Alfalfa seed	18@20
Mustard, brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, ton	23.50

Feed Stuff.

Alfalfa meal	17.00
Bran, ton	25.00@26.50
Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Rolled barley, ton	30.00@31.50
Rolled oats, ton	27.50@29.00
Middlings	33.50@36.00
Oil cake, ton	40.00@41.50
Cocoanut cake, ton	25.00@26.00
Mixed feed, ton	25.00@27.00
Shorts	25.00@26.00

Citrus Fruit Market

LOS ANGELES, April 19, 1911.

The manner in which the orange market is being handled and the great output moved off at satisfactory prices is as surprising as it is agreeable to the orange growers. An output of nearly 50,000 carloads of citrus fruits caused many to express concern as to whether the limit of production is not reached, and many freely expressed the fear of disastrous conditions this season, but navel shipments have reached a stage where it is practically assured that they will all be disposed of before June 1 and at a satisfactory average. To be sure, there has been some decay, which will continue, but the exceptional care now being observed is reducing this to a minimum. Precooling is also very general. Shipments so far this month have averaged below 200 cars daily, but even at this rate all can be handled before Valencias are thrown on the market. Of Valencias there will be between 8,000 and 9,000 carloads.

Conditions of the lemon market are also satisfactory, good stock commanding at this time $3.00 to $3.35 f. o. b. California. Stock is all first class, and promises for record prices when the warm weather strikes the East are freely made.

Shipments.

Shipments of oranges to date since November 1, 1910, 20,971; lemons, 2,488; total, 23,495. To same date last season: Oranges, 13,688; lemons, 2,027; total, 15,715.

LOS ANGELES, Wednesday, April 12.—Five cars sold here today.

Navels, brand, grade, district, etc. Avge.

ADVANTAGES OF GOOD COMBS.

(Continued from Page 490.)

in uncapping when extracting, and extracting, and breakage of combs in the extractor.

The reduction of the brood capacity resulting from crooked combs amounts in bad cases to one-quarter of the total comb surface of the brood nest. Only when combs are quite straight is the whole of the comb surface available for the raising of brood. The normal spacing of brood frames is 1⅜ inch from center to center. The distance has been arrived at as the average of many measurements of the worker combs of bees built in a state of nature. Left to their own devices, as in box hives, bees will rarely build their combs in straight lines, but, whatever their shape, there is always a space just sufficient for the purpose between opposite faces of brood combs.

It is different in the case of combs in frames. The placing of crooked combs between straight ones or bent the reverse way, brings the surfaces in places so close together that one side cannot be occupied by brood or, if containing brood already, it will be removed by the bees to produce the required space. Large patches of vacant cells are thereby created, spreading the raising of brood over a larger surface, or restricting development of the colony in early spring owing to insufficient animal heat for the larger space. Apart from the blanks referred to, there are, in combs built on buckled foundation, a considerable number of cells which cannot be used for worker brood. The cells on the convex side of the curve of the comb are too large, while on the concave they are too small.

The greatest drawback of crooked combs, however, is the difficulty of, and waste of time in, uncapping the combs for the extrator. A straight comb can be uncapped with one cut of a 12-inch honey knife, while a crooked one requires a number of cuts at different levels. During this operation the structure of the comb is more or less damaged and the comb weakened, resulting in fractures in the comb baskets of the extractor. Combs are in use for many years. I have some twenty years old. It is therefore good economy to get them as nearly perfect as possible in the first instance and save the time wasted in handling bad combs. The labor of the bees is also put to the best use in the raising of brood.—Journal of Agriculture, N. E. W.

Standardize the Fruits, Standardize the Grower

Address before the Fruit Growers Convention at Stockton by Marshall De Motte, of Corning, Tehama County.

The conditions under which most of the business of the world is transacted have come to us through years of gradual growth and development, and success has been attained and the laws governing success formulated by a process of natural elimination and survival, so from the standpoint of experience theory can be evolved and practice told with clearness and precision, but regardless of the fact that fruit has been marketed for more years than have carpet tacks, and that it has been proven with tacks and all other staple merchandise that a dependable package is essential, yet it has been left for the last few years to develop the first inclination toward a strictly dependable package of fruit. I am sure that this condition exists simply because the theory of public utility, commercial desirability and financial benefit to be derived from having a dependable pack has never before been deduced. It has been a proverbial misnomer that the farmer is practical, but the Yankee farmer who packed his apples with a fine face and the rest of the barrel culls was as impractical as the ostrich who stuck his head in the sand to get out of sight. Though from his own standpoint each might laugh at the other, we can laugh at both. The Yankee farmer with his apple pack was own father to the Western orchardist who until within a comparatively few months has pursued a similar course.

Then along came a bunch of Oregon apple men. I am not sure that they were the first to standardize, but they got the limelight very early. These Oregon men apparently undertook to show the world two things; one that they grew good apples, and the other that they grew enough good apples to fill a whole box with apples equally good; and in this they advertised their locality, that they might sell their land. I take it that it was for no moral or altruistic reason, simply business. But it took the world by storm, and did several things besides the above mentioned two, for people everywhere gave them the credit of an honest purpose, and the world praised them for their honesty, while they praised their apples and their valley until it began to look as though they were the only people who could do such things. Have you ever heard that as good an apple, or better, can be raised in New York or Michigan than in Oregon? We have all heard such a statement, and no one who has had an opportunity to judge questions its truth. I am told that a few growers "way down East" are awakening to the possibility, not of growing better apples, but of standardizing their pack, that they may get into the market. If they do this, we know that success will come to them where failure has been with them in the past.

The Psychological Moment.

Consider, for a moment, the fruit industry as we faced it a year or two ago, before we got a standardized state horticultural commissioner. It was not a question of fruit, for methods for the production of both quantity and quality have been taught to our growers so that even quality can ask for little more. It is not a question of honesty, for honesty is individual, and you cannot make all men honest, not even by rules or laws. But it was a question of first realizing our need, and then of adopting some means of getting our fruit packed and on the market that would place it in the class of dependable commodities and worthy of the best price the market could pay. Common practice has long since taught the makers of most staples the necessity of putting out a dependable pack, and common practice would doubtless eventually have pounded this necessity into us fruit men, but it was taking too much time. Organization, we are finding, will do it much more quickly.

Nails and Fruit.

Farmers are generally called honest, but if the ordinary fruit packing of former years be considered as a study in honesty, then there has generally been more honesty in the packing of a five-cent paper of tacks than a whole carload of fruit. When you go to the store to get a keg of three-penny nails for your fruit boxes, you find the same size nail in the bottom of the keg, and net weight. Now, you know that twenty-penny nails are cheaper. Why does not the maker of the nails put a few twenties in the bottom of the keg? If he buys fruit, he is likely to find it packed that way. The low-browed son of Europe who filled that keg is not more honest than your packing crew, and he packed as he did, not because of his honesty, but because of the rules under which he worked, and an equally dependable package of fruit will come only when your rules and the public demand have placed fruit in a similar trade position.

Mechanical Honesty.

This whole business must be taken off the plane of moral honesty, because not all men are morally honest, and put on the plane of business expediency, or as I said on another occasion, not moral honesty, but mechanical honesty, that is, doing the thing right and always the same because that is the way and the only profitable way to do it. You must so drill this into the people who do your packing that they will know no other way, thus educating the public till they refuse to do business with men who do otherwise.

It has taken years to get fruit growing up to the present state of perfection and it may be that the delay in undertaking general standardization has been the natural awaiting the time when men could raise fine fruit and go at it to do the same thing season after season. One year's work in standardization furnishes ample warrant for our expectation that speedily the fruit trade will be on a par with tacks and nails and sugar and such things, and that we will be doing by others as we expect them to do by us. We have started, let us go forward.

The Eye Sells the Fruit.

To be sure selling tacks is different from selling fruit. A man buys tacks because he needs them, but he buys fruit because he wants fruit, and for this reason the utmost care should be used in preparing it for the market. Very generally it is said that the eye sells the fruit and this appeal to the eye of the consumer must be the means of compelling the need of our merchandise. But just think how many eyes must play salesmen in the transaction before the fruit comes to the eye of the final consumer, and each eye that has a part in the sale must be single in its purpose of achieving the highest end, the greatest profit. So, to get the best results and realizing that the eye sells the fruit, we must guard against the eye of greed on the part of the grower who would neglect the well-known and tried methods of cultivation and produce quantity at the expense of quality and attempt to force this on the market. We must guard against the eye of deception in the packer who would try to make such fruit look better than it is. We should labor with the railroads who manifest the eye of avarice and seek to get out of the business, not their just share, but all that the business will stand. We must guard against the eye of cupidity on the part of our selling agent, but what can the man whose eye is evil, be he grower of poor fruit or packer of deceptive packages, say to the crooked agent who is simply another branch of the same ill-kept stock. Get ourselves right and we will be able to demand and get right from others. After the fruit has passed through all its stages under eyes single to its perfect growing, packing, shipping and selling it will meet the final delighted eye of the consumer and our reward will come. It cannot be that this condition can be reached other than through standardization.

Standardization.

We must standardize from the ground up, that is, we must standardize from the locality up, or from the state horticultural commission down. The fortunate experience of the past year has left little for me to say on standardization of our state horticultural commission. The same high standard should be set for every county and deputy commissioner. This business is too important and serious to be allowed to drift into politics. It is our business and it will be our fault if we ever submit to political influence in this particular work.

Standardize Nursery Men.

The nursery man and his stock need to be standardized. A few years ago pedigreed nursery stock was unknown, a standard could not be set and chance ruled results, but it is known and appreciated now that nursery stock can and therefore must be standardized and we will soon find a way to test a man's stock by known standards and make him live up to name and variety in harmony with his claimed pedigree. Our farm school is at work on fruit tree standards and pedigrees now.

Standardized Localities.

A third and important step in this course must be the standardization of localities. In the old communities this has been gradually done, but the vast new tracts that are being put on the market for colonization should be thoroughly studied for standardization.

The real estate man who claims that his land will grow anything but hair on a bald head must find and admit that this is but a small fraction of a truth. To grow, and to grow profitably are two radically different things. Each soil, each altitude and each locality has its preferences and these things must be studied to standardize. I am sure of this because I live in a community that has passed through its period of standardization. In 1892, eighteen years ago, the Maywood Colony, the oldest successful colony in the northern part of the state, was organized at Corning, and soon after the Richfield Colony was started at the same place. The ignorance of the early settlers, who came for the most part from the East, was fully matched by the ignorance of the local people as to what would thrive and as to cultural methods. Remember that when these colonies were started there was no local data and that many of the old settlers claimed that fruit would not grow there at all. Time has been the school room; failures, successes and experiences the studies that have graduated this community in standardization, and today her diploma reads olive, Elberta peach, almond. These three crops do best there and should be stuck to for commercial planting regardless of the fact that almost every other kind of fruit from oranges and lemons down, does well. Special plots of land for certain reasons may be specially suited for certain other crops but the locality as a whole should be carefully standardized to get the best results for all. To this end each town should have a permanent local exhibit of its

(Continued on Page 522.)

CITRUS Trees

Buy and Plant Citrus Trees NOW

We have a magnificent stock of the best varieties still on hand and are prepared to fill orders for almost any quantity from our extensive nurseries either at Whittier or Exeter.

ORANGES

As a revenue producer, where conditions are favorable for its development, one year after another, we know of no more profitable variety than

THE VALENCIA LATE

On account of its coming on the market in the late spring and early summer months and the further fact of its being an acid fruit, makes it sell nicely in connection with deciduous fruits.
VALENCIA LATE ORANGES have sold at higher prices than any other oranges and in favorable localities where there is no danger of the fruit getting frozen, the Valencia is sure to be a money winner on account of its increasing strong demand. It is a vigorous grower and prolific bearer. Actual returns from producing orchards show more net profit per acre than from any other orange grown. We have a fine stock of 2-year-old trees and can fill your orders for these trees as well as the WASHINGTON NAVEL in almost any quantity.

Citrus and Tropical Fruits

A WIDENING HORTICULTURAL HORIZON.

By F. W. Popenoe, Pasadena.

With a climate adapted to the growth of a majority of the plants of the temperate and tropical zones, California has an almost unlimited field upon which to draw for new and interesting products. Every year a number of new plants are added to the already large list of those that can be successfully grown here, and yet our horticultural resources have scarcely been touched. The tropics and subtropics of the whole world is the field to which we can look for interesting and valuable things to be grown here. Vast numbers of plants which are commonly found in cultivation in tropical countries have never been given a trial in California, and beyond this there are still extensive regions to be explored. Among the plants already introduced which have proven their adaptability to this climate are several which give promise of coming into general demand in the near future. Some of these are already beginning to attract the attention which their value merits and will soon be counted among the commercial fruits of California.

At present the Avocado is claiming the attention of many horticulturists. This salad fruit promises to rank with the orange as a commercial product, indeed even to outstrip it. Being of a tropical nature, its culture is restricted to California and Florida, and the demand for the fruit is rapidly increasing as it becomes known, so that it is sure to be one of the most profitable that can be grown in the localities to which it is suited. The Avocado possesses a high food value and for that reason will be considered not as a luxury but as a food product. The avocado industry is already established in Florida and the next few years will see its establishment here along the same lines. The California nurserymen are now directing their efforts toward the securing of choice varieties from Mexico which are adapted to this climate, and once these are established it will not be long before the culture of this fruit becomes an important matter.

The mango is one of the most important tropical fruits, and has been aptly termed "the apple of the tropics." In its finer varieties it is one of the most delicious fruits grown. The fruits are commonly red or yellow in color, weighing from a few ounces up to three pounds or more, and the juicy yellow pulp is most fragrant and delicious. It is cultivated in all tropical countries, and in India has been under careful cultivation for centuries. Countless varieties have there originated, of which over two hundred are now catalogued, and it seems practically certain that of the innumerable varieties, suited to a wide range of climatic conditions, some will be found suited to the conditions which obtain here. At Saharanpur, in the northern provinces of India, where a collection of over fifty varieties is successfully grown, the climate is somewhat similar to ours, there being a distinct wet and dry season, and the winters are cool. The superintendent of the botanic gardens there states "undoubtedly a high temperature is necessary for the ripening of the mango, and moreover a dry one is preferred. The fruits ripen here from May to July, and they thus have the hottest and dryest time of the year in which to ripen. Generally there is during May a hot dry wind which no doubt acts on the acids of the fruit." Professor C. F. Baker of Pomona college, an economic botanist of wide experience in tropical countries and a scientist of more than national repute, predicts a great future for the mango in California, and believes the establishment of a mango industry is only a matter of testing as many varieties as it is possible to obtain and finding those which are suited to this climate. The mango has never been given a thorough trial in California, in fact it has scarcely had any trial at all, the few trees which have been planted being seedlings of Mexican fruits from locations widely different in climatic conditions from ours. These trees have, however, withstood the climate for as much as 25 years in one case at least, and made considerable growth and produced fruits of fair size.

A plant which promises to far surpass the strawberry guava as a popular favorite is feijoa sellowiana from South America, introduced into California in 1901 by Dr. F. Franceschi of Santa Barbara, whose untiring efforts for the last fifteen years or more have added many valuable and beautiful plants to California gardens. It is closely related to the guava and resembles it in habit and character. The green, egg-shaped fruits are of most delicious pineapple flavor, and are always appreciated by every one. It is perfectly hardy here, and indeed is found to be hardy in England, and it will probably rank as a commercial fruit in the near future, as it stands shipping perfectly. The shrub is most ornamental, and taken all in all, the Feijoa (pronounced Fay-zho-a, accenting the middle syllable) far surpasses the guava in points of value.

The white sapote (Casimiroa edulis) is a Mexican fruit which has been grown here to a very limited extent for many years, it being brought from Mexico by the Franciscan fathers and claiming the honor of being the first tropical fruit introduced into California. It succeeds perfectly, and the fruits which resemble in appearance an apple or a quince, are of most delicious peach-like taste. When its propagation is better understood, so that the finer varieties can be perpetuated, it will doubtless become common all over California.

The Cherimoya (Anona cherimolia) is fairly well known here already. It is easily grown and the fruits are sold at very remunerative prices in the local markets. The better varieties are of good size and delicious flavor and as these are now propagated by budding this fruit bids fair to become popular here and of considerable commercial importance.

A tree which will undoubtedly become important is the Queensland nut (Macadamia ternifolia). It is very ornamental, having dark green, holly-like leaves, and is quite hardy. The nuts are similar to filberts, but about one inch in diameter and have a much thicker shell. They are of very fine flavor, similar but superior to the Brazil nut, and are said to sell in the London markets for $2.50 a pound. Although the tree is a slow grower and does not come into bearing until

seven or eight years old, it produces regular and prolific crops after that time and is certain to be a very profitable tree.

Numerous species of guavas (Psidium), many of them introduced by Dr. Franceschi, are proving well adapted to this climate and will be found valuable additions to our list of fruiting plants. These fruits are widely used in tropical countries for making jellies and jams, and will be grown here for the same purpose.

Several species of eugenias, such as E. Jambos, the Rose Apple, a fruit resembling an apricot but deliciously rose scented, are a success and will become popular in time, although it is doubtful if they will reach a commercial importance.

The papaya or papaw (Carica papaya), is very highly esteemed in tropical countries, has been successfully fruited in the open at Hollywood for a number of years. While the fruits produced have been small and scarcely palatable, by the introduction of varieties better suited to this climate this fruit might become a valuable acquisition. It seems more tolerant of cold than excessive moisture, and for this reason might be found better suited to the dry interior valleys than to the coast country.

There are numerous other fruits which are little known as yet, and the list of fruiting plants which will succeed in California is constantly being added to, so that many which are not known here at present will in time prove their citizenship, and thus through the efforts of those interested in the introduction of economic and fruiting plants, our horticultural wealth will all the time be increasing.

ALKALI FROM NITRATE OF SODA.

Referring again to the letters of Drs. King and Hilgard on the possibility of charging soils with black alkali through excessive use of nitrate of soda, we have asked for expressions from orchardists and have the letters given below. We may add also that we have heard of applications of nitrate of soda to the extent of 35 pounds at one time to young orange trees with no apparent ill effect. Mr. Carroll B. Smith of Redlands feels that the case made by Drs. King and Hilgard is worthy of serious consideration. However, it will be noticed that in his letter he admits that he is still using nitrate of soda in his orchard.

Carroll B. Smith, Redlands.

As regards the discussion relative to nitrate of soda producing black alkali as stated by Drs. King and Hilgard in their letters read at the recent San Bernardino Fruit Growers Association, you must remember that these warnings have special reference to the future, say, 40 or 50 years or more, and are based on the experience of older countries, notably England. And the contention of these gentlemen, while their authority alone would be sufficient, is also strongly supported by A. D. Hall, director of the Rothamsted Station, England, and many others.

It cannot be denied that the use of soda has been wonderfully beneficial to our groves as regards crop production and general health and vigor of trees, especially where the spring application is necessarily late, and I am using it myself, yet this does not affect the contention of the gentlemen mentioned. It is a timely warning which 50 years from now may be an interesting bit of history.

Prof. J. H. Norton, Chemist in Charge, Citrus Experiment Sta., Riverside.

During the last six months I find the following articles published in the Cultivator: Oct. 13, "The Great Soil Convention;" Nov. 17, "Nitrate of Soda;" Jan. 19, "Nitrate of Soda as a Fertilizer for Citrus Trees," "The Rational and Irrational Use of Nitrate of Soda;" Feb. 9, "Nitrate of Soda Again," and Mar. 16, "Citrus Fruit Growers Convention." Each of these articles dealing more or less with the objections to the use of nitrate of soda as a fertilizer under our Southern California conditions, and at your request would like to add another opinion or rather review these articles.

This whole discussion was precipitated by Dr. King bringing up the fact, which by the way is nothing new, that the residue left by the use of nitrate of soda formed sodium carbonate or black alkali in the soil. The harmful effects of black alkali as well as its formation from the use of nitrate of soda is conceded. Then the only point which admits of discussion is the possibility of the accumulation of enough black alkali under local conditions to do the dreaded injury to our soils.

A case came under my observation last summer in which about one per cent of the nursery trees in a young nursery had died and on inspection it was found that the trouble was just beneath the surface of the soil. This was a heavy adobe soil with only a trace of alkali in it. The nursery had gone a long time between irrigations with very, very little cultivation and the result was that all of the little alkali had accumulated within one inch of the surface of the soil. This being the case the alkali solution at this point was strong enough to attack the young plant in about one per cent of the cases and girdle it just beneath the surface of the soil. If this case represents Southern California conditions then it would be highly objectionable to use even a trace of nitrate of soda. Referring to the closing paragraph of Dr. Hilgard's letter in recent Cultivator he says that the adobe soil is the exception and the light and pervious soil is the rule in this state. The cultivation of the above nursery was nothing like representative of this section, so the case cited is the rankest extreme. Another extreme case I have in mind is where I used 25 pounds per tree of nitrate of soda at one application without any specially marked benefit and no injury whatever. This soil was of a very loose sandy nature well cultivated and well irrigated.

Then the question is at what particular point between these two cases does the particular soil we have in mind lie. The nearer we approach the above type of soil, the poorer the cultivation and the poorer the irrigation, then the more danger there is in the use of nitrate of soda.

All this discussion has been too general except that of Dr. Hilgard and he has pointed out how leaching of alkali from the majority of our soils undoubtedly takes place and now is the very time to determine this question for the particular soil you have in mind. The recent rains have penetrated many soils to the depth of ten or twelve feet and in that case the alkali has gone down also and in soils open enough for this penetration to take place a return of the alkali is hardly probable. It is surprising how many of our soils, in spite of

(Continued on Page 532.)

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Cheap Land

In the United States

If you want GOOD land, at a LOW PRICE, you must turn to MEXICO.

Do you realize that Mexico has attracted MILLIONS of American capital and thousands of American citizens in the last few years? And the rush has only started. It will soon be a FLOOD.

The greatest and most advanced of all the land projects of Mexico is that of the

Great Yaqui Valley

where more than 500,000 ACRES of the finest land in the world is being brought under irrigation. Every condition necessary to SUCCESSFUL and PROFITABLE farming exists here. Already 15,000 acres of this land is under cultivation and AMERICAN farmers own it.

I still have a few thousand acres of this superb IRRIGATED LAND, in tracts of 50 acres or more, at the very low price of

$27 Per Acre

This price includes the cost of a lateral ditch to every tract of land sold. This is the price NOW—later it will be HIGHER.

Call or write for pamphlet and full particulars.

Deciduous Bush-Tree Fruits

STORAGE IN TRANSIT.

The apple season of 1910 and 1911 will always be remembered as remarkable for the extremely high prices paid for barrelled apples, which have been the highest in the history of the apple industry, and the extremely low prices for box apples, which have been the lowest in the history of the apple industry.

The demand at all times has been dull and dragging on boxes, and strong and active on barrels. This in spite of the fact that the quality of box apples has always been superior to barrelled apples.

What is the reason of this paradox? Can it be possible that the more scientific and careful the growing and packing of apples become, the less they are appreciated? Has the expert packing of apples, which has reached its highest development in the apple-producing sections of the Pacific Slope, only had the result of making the public prefer the rough-and-ready, slap-dash packing of barrelled apples, especially when it is known that the great majority of these barrelled apples contain, with the exception of those on the face or top of the barrel, apples suitable only for cooking? No, there is a sensible reason for the fact that box apples have not been wanted and have ruled at low prices. The reason lies in the method of distribution of the two classes of apples. The barrels have been shipped to every market in the country, large and small. There has been a strong demand for them in England and Germany. Western New York fruit houses have had a steady demand and drain on them from the West and the South and from the East and from the lands across the sea. There was about an equal quantity of apples packed in barrels and boxes; the barrels are being consumed in a thousand places, the box crop practically was marketed in two places—Chicago and New York. Of course, there was some small amount of boxes shipped abroad, especially California Newtons, and some few cities like Philadelphia and Boston had a small amount of boxes, but the markets of New York and Boston were at all times over-supplied. The newspapers are filled with flashing advertisements on the part of a few dealers stating the hundreds of thousands of boxes that their firm would have the distinction of handling. One Chicago house blazoned forth to the world that they had disposed of a thousand cars. The impression was given that the quantity was so unlimited on the part of every large dealer in Chicago and New York that every smaller dealer shut out the temptation of investing in them.

This absolute lack of intelligent distribution came about through the rigid rules of the railroads regarding freight rates on box apples. One dollar per hundred is the rate on a carload of box apples, whether shipped to Denver, Chicago or New York, and when stored at one point or the other it cannot be reshipped without paying another freight rate. If a storage in transit privilege should be allowed on shipments of box apples, there would at once develop a system of distribution which would scatter the crop of box apples all over the country; it would place them in consumption where they were most wanted. The crop of box apples, amounting to twenty million boxes, is transported in a month and a half, but it requires nine months to consume it, even though it should be scattered in every city, large or small.

By the storage in transit privilege is meant the privilege to ship the car to any warehouse that is desired, and later on, when the owner desires to market that car of apples, to ship it to its ultimate destination and pay for the total services the through rate from the initial point of shipment to the ultimate destination, and a switching charge in addition, because that is the only extra service in addition to the through haul that the railroad has rendered in granting this privilege. It is impossible for the owner of a considerable amount of box apples, whether he is a grower or the Association of Growers or a merchant who has invested his money in their output, to tell what market during the coming nine months after the crop is gathered will be a desirable market for his apples. He can tell less because it is a new industry and only cities of the larger size have developed the use of box apples.

With the very great increase in the production of the far western orchards, amounting last year to twenty million boxes, it is essential for the prosperity of the growers in the far West, or any person who desires any part in that industry, whether railroads or warehousemen or merchants, to do a lot of missionary work in scattering the crop and introducing it to the cities of smaller size and the European markets. A lot of this missionary work has been done already, and the crop would flow to cities of the second class as well as the first class if the railroads would see to it that a flexible method of distribution was permitted by granting the storage in transit privilege. The greatest benefit would go to the railroads between Chicago and New York. In that district half of the wealth of the country lies, and half the crop of box apples should be there distributed. With the exception of one railroad, the Erie, the other transcontinental lines from Chicago to the East have next to nothing of this traffic. The storage in transit privilege would give to them a very large share of this traffic. It is of the utmost importance, therefore, that all growers and growers associations and all apple dealers should bring this information to the attention of the head officials of railroads—it will help them more than it will help the general industry.

In addition, it is a matter of importance to all persons interested in the apple industry, whether in barrels or boxes, because if the box industry is placed upon a healthy and profitable basis the capital available for investment in apples will flow toward that part of the industry and leave the barrelled apples open to a natural competition, but not to the excessive competition that now exists.

Yet grieve thou not, nor think thy thy youth is gone,
Nor dream that glorious season e'er could die.
Thy pleasant youth, a little while while withdrawn,
Waits on the horizon of a brighter sky. —Bryant.

RAISIN HISTORY.

In the old days, the far days, when the world was younger and simpler, raisins, figs and honey were the only sweets. Sugar, even in Roman times, was a rare drug, prescribed for medicine. Sweet foods and drinks were made with honey and raisins. The sweet wine, which the Roman matrons were permitted to drink, in the sober times of the republic, was a sort of a syrup of raisins steeped in wine. The Greeks had a similar syrup, prepared somehow with smoke. In all the Mediterranean countries, raisins were one of the earliest and most universal articles of food. The gift of Abigail to David was "two hundred loaves, and two bottles of wine, and five sheep ready dressed and five measures of parched corn, and an hundred clusters of raisins and two hundred cakes of figs." When David, pursuing the Amalekites, came on a famished Egyptian slave left behind too weak to talk, they "gave him bread, and he did eat; and they made him drink water; and they gave him a piece of a cake of figs, and two clusters of raisins; and when he had eaten, his spirit came again to him." One of the prohibitions of those who had taken the vow of a Nazarite, during the time of their separation, was that they should not "eat moist grapes, nor dried." During all the Middle Ages, raisins were one of the articles of commerce, across Europe, when almost all other commerce was stopped. Raisins were part of the food served by the early Russian Czars to their drujina, or followers. During the darkest of the Dark Ages, some commerce still survived, in the most precious things—pearls, silks, wine, women and raisins. England has been, for more than a thousand years, the principal raisin importer of the world, deriving her raisins from Spain, Smyrna, Calabria, the Lipari Islands, the South of France, and, recently, from Africa, Australia and South America.

The oldest way of making raisins is simply to leave them on the vines until the clusters are dried. Those are Shakespeare's "raisins o' the sun." A quicker way is to cut the stalk part way through, to hasten drying. More commonly, they were cut and laid on the ground. "Dipping" has always been common—in Spain and France, dipping in a lye solution; in Asia Minor, dipping in hot water on which floated a film of olive oil. The finest raisins have always been served in clusters; the commoner sorts were always more or less separated from their stems.

These were the raisins which were the world's luxury, until California produced better raisins, more cheaply, for the world's food. California produced for the first time clean raisins, dried on wooden trays. California first equalized the moisture and graded the size of raisins. California first marketed stemmed raisins really stemless, and finally seeded raisins really seedless. California first offered a surfeited world already cloyed with sweets, raisins palatable to even its jaded taste. And now California raisin day publicity is teaching the world a hundred new ways to serve raisins, and a hundred new reasons for eating them.

The only foods older or more universal than raisins are meat and bread. From the beginning of time, raisins have marked the center and the spread of civilization. They were the first luxury, and have been the chief delicacy of mankind. Of all staple things, only wheat and beef surpass them. And of all staples, no others are so strictly limited in their field of production.—Fresno Republican.

APRICOT OUTPUT.

Continuing the observation made last week regarding the coming apricot crop we quote below the opinions of other growers. We may also add that many sections of the Sacramento and San Joaquin Valleys were visited on April 13th by severe frosts which did great damage. This was less apparent on apricots than on peaches and some other fruits. It now appears that the damage will not be so complete as at first feared, as careful examination in many sections shows full setting of fruit uninjured. Reports from the section about Santa Ana are that the warm weather of the last two weeks has produced a rapid growth which has put apricots out of all danger from foggy weather or rains, and a large crop is now practically assured.

Hilling Sweet Potatoes with Planet Jr., in New Jersey.

L. T. Webster, Carpinteria, Santa Barbara County.

It is hard to make an estimate but from present prospects they are below normal and not one-half of last year. We had a cold rain the last part of March and stayed foggy for ten days. The old blossoms were still on the young cots and they rotted badly.

M. W. P. Wright, Moorpark, Ventura County.

In our little valley here a severe frost has materially hurt our fruit and we look for a very small yield.

H. O. Sorkness, Hemet, Riverside County.

We had a prospect of a good crop of cots here until last Saturday morning when we had a frost that hurt many of the orchards. Some of the more favorably located are not hurt so badly and will have a good crop, but a great per cent of the orchards are badly hurt. Some will not have more than one-fourth crop. What per cent of crop the entire valley will have is hard to say as yet.

A. S. Westmoreland, Valley Center, San Diego County.

The apricot crop of this valley will be very short, due largely to the heavy rains about April 1, when in full bloom. Many trees have shed their entire bloom, others not quite so bad, and can estimate the crop now at not more than one-sixth of a full crop. The weather has now cleared up, warm and pleasant, and we expect a heavy crop of peaches, prunes and plums.

F. E. Lowe, Oceano, San Luis Obispo County.

The apricot crop of the Arroyo Grande Valley and vicinity promises to be much better than last year, probably almost a full crop. It has been necessary to thin the cots in some orchards.

H. E. Twomley, Santa Paula, Ventura County.

In reply to your letter, will say that the crop in this section seems very spotted. Some report heavy crops, while others are nearly failures. The continued rain and foggy damp weather seemed to rot the cots on the trees before the dried calyx had shed off. As for myself, I expect a half crop. Last year I had twelve tons of dried fruit; this year I am looking for six tons and will hope for eight tons. Two years ago I had thirteen tons. I thank you for taking this means of informing the growers as to the existing conditions of the crop of the state, that we may know better what to expect.

Thomas W. Spier, Ventura, Ventura County.

It is rather early to say just what the apricot crop will be. Some growers to whom I have talked say the crop will be light, others expect a fair crop. From my own observation I should say the crop will be 65 per cent of normal, certainly not a full crop. Late rains, frost and heavy winds have hurt the crop. Later in the season I can give you more accurate data.

John Tuohy, Tulare, Tulare County.

Apricots will be a short crop.

A. Hancock, Bakersfield, Kern County.

Apricots will be light in this county. Don't think over half a crop.

SPRAYING FOR THE CODLING MOTH.

It is a recognized fact that if the fruit grower expects to get a good crop of apples he must prune, cultivate, irrigate and fertilize the orchard at the proper time. Yet, very frequently, after we have gone to the trouble and expense of performing all of these orchard operations, we fall down at the last moment, and permit from one-half to two-thirds of the crop to be destroyed right before our very eyes by insect pests. Spraying is now considered as necessary in orchard operations to produce a crop of sound apples as pruning or irrigating. There is no longer any doubt as to the good that spraying does. Just consider the vast sums of money that are being expended every year on the spraying of trees throughout the United States. Why do fruit growers do this? If the results at the end of the year did not show up favorably, can we believe that such large expenditures for fighting insect pests would be continued? Stop and think of it. Aside from this, it has been shown time and time again by numerous experiments conducted at the different experiment stations that spraying, properly done, is about the best way to keep under control our worst orchard pests. It is true, however, that the same number of sprayings will not give equally satisfactory results in all sections of the country. In the Eastern states two sprayings seem to be necessary, but in the Central states two to four sprayings are recommended; while farther west more sprayings are necessary to get satisfactory results. In New Mexico, due to the great difference in altitudes and climatic conditions, it is probable that the number of sprayings for best results will vary according to the locality. In the lower and warmer valleys, where the seasons are the longest and climatic conditions as a rule more favorable, it will be necessary to spray a number of times. The results of the spraying experiments are most encouraging, considering that the season was not a favorable one for this work. In these experiments seventy trees, averaging in size 10 feet by 17 feet, were sprayed with arsenate of lead at the rate of three pounds to every fifty gallons of water. The trees were sprayed six times, on the following dates: April 21, May 14, June 7, July 6, July 30 and August 26. The amount of spraying mixture used in the six sprayings was approximately 1,450 gallons, which cost $13.50 for the arsenate of lead. A gasoline power sprayer and three men were used in the spraying of these trees. The total time for the six sprayings, including the filling of the tank—which, as a rule, took longer than to empty it—was 22.3 hours, or at the rate of 3.38 hours per spraying. On October 15, 1910, 7,780 apples were gathered from eight Arkansas Black and eight Mammoth Black Twig trees. Out of this number there were 6,405 sound apples, or 81 per cent, and 1,375 wormy, or 18.95 per cent. From two Arkansas Black and two Mammoth Black Twig trees which were not sprayed, 418 apples were gathered. One hundred and thirty-six, or 32.95 per cent, were sound, and 282, or 67 per cent, were wormy. Compare the results from the sprayed and unsprayed trees, and see whether or not spraying did any good. Eighty-one per cent of the crop gathered from the sprayed trees was good, while on the unsprayed trees 67 per cent of the crop gathered was wormy. Even in the windfalls the percentage of sound apples was in favor of the sprayed trees. The same number of sprayed trees had 34 per cent of the windfalls sound and 65 per cent wormy; while the trees not sprayed had 2.8 per cent sound and 97.2 per cent wormy. It is believed that if everybody in the locality would spray at the same time, even larger percentages of sound fruit than are here reported could be secured. Arsenate of lead at the rate of three pounds to fifty gallons of water was the insecticide used in these experiments. In many other sections two pounds instead of three are used. In these experiments the plan has been to spray once every twenty-five days. The first spraying should be done just as the blossoms fall. Special pains must be taken at this time to get the poison into the calyx cup of all the little apples. A high pressure—from 100 to 200 pounds—is necessary for the best work, though 80 pounds will do. Spraying will pay, but to get the best results every apple grower should be alive to this important question. If the trees are not sprayed, they make excellent propagating places for the moths.—Fabian Garcia, New Mexico Experiment Station.

DWARF MILO MAIZE
A DRY LAND CROP

Where the rainfall is limited or water is expensive there is no more profitable forage and dry feed crop than **Milo Maize.** It belongs to the sorghum family of tropical Asia and Africa, where it is the principal grain grown.

We have secured a stock of a dwarf variety that has been thoroughly tested in Southern California and Arizona, yielding two and one half tons of grain per acre. It grows a stalk 4 to 5 feet high with large, compact, erect heads, and stock especially like the sweet flavor of the stalk.

Garden and Field Crops

THE BEAN WEEVIL (BRUCHUS OBTESTUS SAY.)

By E. O. Essig.

The adult weevil is about one-eighth of an inch long. The color is a grayish brown with a velvety greenish cast. The head is bent at right angles to the body downward. The wing coverings or elytra are shorter than the abdomen and are sometimes marked with gray spots in addition to the above color. These spots are more distinct after the beetle has been dead for some time, but are not noticeable in the living forms.

Life History and Work.

The eggs are laid on the outside or within the bean pods In the latter case they are inserted through a hole made in the pod by the jaws of the female or they may be inserted through the natural opening of the pod. Yellow pods just ripening with fully developed beans are the most favored food. As soon as the eggs hatch, the young immediately enters the bean by making a fresh burrow of its own or by entering one previously made. In case it does enter an old burrow it soon leaves it, when once within, and makes a new one.

When full grown, each larva burrows near to the outer skin of the bean and transforms. It is then easily located by the circular semi-transparent spot which covers the burrow. As the pupa develops and becomes darker its color shows through the spot, giving it a dark appearance, and makes it easier to locate. As soon as the last moult is over, the adult weevil gnaws through the outer skin and emerges to breed and deposit eggs and bring forth another brood. The weevils continue to breed within the bean pod, if the crop is allowed to stay over time in the field, or in the storage sacks or bins if the crop is harvested. As many as twenty individuals have emerged from a single bean. The number of generations is difficult to ascertain in California, because of the mild winters, and all stages may be found at any time, so it does not take long to entirely ruin a stored crop if care is not taken to keep them out.

Planting Infested Seed.

Weeviled beans are not suitable for seed, as the weevils that come from them attack the green beans in the field in the fall. A large number of the infested beans will not germinate at all, and those which do will produce inferior plants. Do not plant such seed.

Remedy.

As soon as the crop is ripe it should be harvested. If left in the field for but a week over time it will be found to contain millions of the larval form of the weevils. As soon as the crop is in the bins for storage, treat with carbon bisulfid, by placing a quantity of this liquid in a pan on the top of the bin. The gas, being heavier than air, penetrates to all parts of the bin. Seed treated in this way will prevent spread of the weevil, but plants produced by them will be inferior. In treating, use one pound of carbon bisulfid to every 1,000 cubic feet. Do not allow the liquid to come in contact with the seed.

In infested fields it is also advisable to plant a few rows early to serve as catch crops. When the beans are nearly ripe pull the vines and destroy them. This will destroy a great many of the weevils and save the later and important crop. It is also advisable to make late plantings as catch crops.

Other Bean Insects.

The insects referred to by the Madera subscriber are probably flea beetles, plant lice or aphids and the common cucumber beetles. They may be handled as follows:

Flea Beetles.

Small jumping beetles which feed upon the foliage and often do great damage to young plants.

Remedy: Spray with arsenate of lead in the following proportions:

Lead arsenate	8 lbs
Water	200 gals.

Plant Lice or Aphids.

These are probably the insects referred to as gnats by the subscriber. They are small two-winged or wingless, soft-bodied insests which gather in great numbers on the tender shoots of plants.

Remedy: Spray with kerosene emulsion, carbolic acid emulsion, or with tobacco extract.

Kerosene emulsion:

Kerosene	1 gal.
Soap (soft)	½ lb.
Water	15 gals.

(Mix when water is hot and soap all dissolved.)

Carbolic acid emulsion:

Whale oil soap	4 lbs.
Carbolic acid (crude)	½ gal.
Hot water to mix	4 gals.

Dilute 1 to 20 of water.

Tobacco extract:

Black leaf extract	1 gal.
Water	50 gals.

Spotted Cucumber Beetle.

Adult insect is about the size of the common red lady-bird beetle (one-quarter inch in length). Yellowish green in color, with twelve black spots on its back. Works on a great number of plants.

Striped Cucumber Beetle.

Adult about the same size as the spotted form. Is greenish yellow in color, with three black stripes running nearly the full length of the wing covers.

As a preventive, spray with Bordeaux mixture, or with tobacco extract and a little carbolic acid.

As a poison, spray with arsenate of lead as recommended above.

THE MAN WHO CHANGED THE VALLEY.

"It was Burt, the drayman from Carson City," writes S. Glen Andrus in Sunset Magazine for May, "who with a working capital of $1,000 gave the ranch kings of Northern California and the capitalists of the East the economic lesson of their lives. With his $1,000 savings Burt made his first payment on his little farm, built his house and barn with his own hands, and began to farm it as farming should be done. With only seven acres of land for cultivation, Burt sowed three acres to alfalfa, and around the home he planted a small orchard; between the trees he planted berries and vegetables; under every tree he placed a bee-hive, so that the bees might pollenize his trees while storing for him their golden honey. He kept on planting and sowing things until every foot of land was made to do double and treble service. Still he had land left sufficient to devote to a chicken yard, a pigstye and a cow pen. In the year 1910 Burt took from his seven acres a total of $2,063, and with his aggregate savings he purchased forty acres more of river-bottom land.

The story of Mr. Burt's little ranch appeared in the Cultivator last October, when it was described as the winner of the Sacramento Valley Irrigation Company's prize for the best cared for and most typical productive ranch in the holdings of that great corporation.

Home Grounds Beautiful

CHRYSANTHEMUMS.

By Howard & Smith, Los Angeles.

Where it is desired to produce exhibition blooms of the largest size, it is advisable to begin operations early in the season. The beds in which they are to be grown should be spaded over to a depth of fifteen inches, and have a liberal dressing of well-rotted manure thoroughly worked through the soil. Begin the work of getting ready a month in advance of the planting time, putting on the manure after the first breaking up of the bed; give a thorough soaking when this is done, and when sufficiently dry turn over again.

This procedure thoroughly incorporates the manure and sweetens the soil, which is a factor of great importance in the production of fine blooms.

Arrangement of Beds.

The best width for a bed is three feet, with a length to suit the requirements of the garden. A path two and one-half feet wide between the plots is advisable. Rake the beds to perfect grade, and construct a narrow ridge five inches high along the sides and end. With this done, we have what is practically a basin for the plants.

Planting.

With the beds prepared as above noted, draw two lines from end to end, ten inches from the ridges at the sides; this leaves the lines sixteen inches apart through the middle of the bed. Along those lines insert the plants one foot apart.

Planting may be done any time from April 1 to June 15. As a rule, however, the early plants give the best results.

Watering.

If the beds are prepared as noted above, there is practically a basin to hold the water. Of this chrysanthemums require plenty, and it should be administered by flooding the bed; lack of water causes hard stems and consequent poor blooms. There is more danger of too little rather than too much water in our dry climate.

Aim to keep the plants growing freely at all times. Keep the beds moist without being soggy.

Staking.

As soon as the plants are set out, insert a stout post at each end of the row, and thoroughly brace same. Between these posts and along the row of plants stretch strong light wires; the first, one foot above the ground, and others to the number of four, one foot apart above the first. At every five feet between the end posts drive a one by two inch by six foot stake, and staple the wires to same at the point they cross. This wire and wood framework should be five feet high; the end posts seven feet long, with two feet buried in the ground to sustain the tension of the wire. With the intermediate posts one foot in the ground is sufficient. As the plants grow during the season, carefully tie them with raffia to the wires.

By arranging the plants in long, narrow beds and supporting as above, they are easy to get at for disbudding, cultivation, etc., and high winds are not liable to break them off.

Pinching.

If allowed to grow unchecked, the plants would reach a height of several feet by fall. To keep them in bounds they should be cut back once or twice during the summer, but not later than August 10. Early set plants may be stopped in June and again in August. For late planted stock one pinching back will suffice.

Assuming that the plants have been pinched back to eighteen inches in August, an abundance of young shoots will start at once; when these have attained a length of three or four inches select four or five of the strongest and remove the balance.

It is to be remembered that each of the shoots left is to be the flower stem crowned with a large single bloom in the fall. If more and smaller blooms are desired, more shoots may be left, but the blooms will not have the size or quality where fewer are selected. As the new shoots grow very rapidly, keep them well tied up, removing all new side shoots which may appear in the axils of the leaves. By October these shoots should be nearly four feet high and ready for the final operation.

Disbudding.

We have here an operation upon which depends the success of the crop, and one in which the good judgment of the grower is constantly called upon.

In warm seasons the buds, especially in the early varieties, often make their appearance by September 1. As soon as they are large enough to handle, select the strongest and remove the balance. It is not always advisable, however, to leave the large one at the terminus of the shoot; this often brings a coarse bloom, and too early. A second bud lower down, although of smaller size, will produce an equally large bloom, but later in the season. After the bud has been selected, keep all side growths pinched out, the idea being to divert the entire flow of sap to the one bud.

Manure.

Chrysanthemums are gross feeders. A liberal mulch of well-rotted manure every two or three months during the growing period aids greatly in the production of fine foliage, heavy stems and large blooms; it checks the evaporation and keeps the soil cool and moist.

Commercial fertilizers, such as bone meal or blood and bone, are useful in accelerating the growth, but care must be used not to overdo; an ounce or two to the plant dusted over the soil and raked in every two or three weeks during the summer is sufficient. An overdose will destroy the root action.

Discontinue all solid forms of fertilizer when the buds appear, giving only manure in liquid form; stop this when the petals begin to appear, using water only.

There are two methods by which you may decide if a potted plant needs water—by sound, and by touch. When you tap the pot, and hear a hollow sound, and when you touch the surface of the soil, and find it dusty, you may know your plants need watering.

If any sort of growth appears on the outside of flower pots, mold or mildew, scour the pots with some of the good scouring powders, mixed with sand. Rinse well, taking care that no part of the plant is allowed to touch the washing powders.

GROWERS AND PACKERS OF STANDARDIZED FRUIT.

(Continued from Page 515.)

standards, that is, its most successful and profitable horticultural and agricultural products.

Standardized Growers.

Does it sound far fetched to speak of standardizing the growers? This is particularly recommended to the new communities where the many men are of many minds and seem to be firm in the belief that they can transplant the methods they used in the East to their Western homes. For instance, to one of the upper Sacramento Valley towns there came recently a man who announced that he would raise mushrooms for the market. If this had occurred fifteen years ago he would have had to spend this money on a failure to satisfy himself, but the place is standardized and he was shown what did best there, and so he did not try mushrooms. Now this was primary work in his standardization. We all have to go through the course in cultural methods that have been so carefully worked out and ably discussed at these meetings and in the columns of our most excellent horticultural press, and should possess ourselves of a full supply of University of California and United States Bulletins. A man so equipped will become standardized, that is, his output will be standard fruit and he will be so instilled with high standard that he will be satisfied with nothing else.

Standardized Packers.

How can a standardized pack be maintained unless the packers themselves are standardized? It will not do to simply bind them with rules; they must be so simply in earnest in this matter that they will introduce into their methods such system of grading and sorting that the element of judgment and field for the operation of moral honesty shall be reduced to the minimum and that no employe will have power to grossly violate the rules of standardization. Only then will fruit packing be done with the accuracy, perfection and mechanical honesty shown in packing nails and other staple merchandise.

Trade Marks.

With the consideration of the packing of standard fruit should come that of the mark of standardization. While it would be gratifying, and to some it might seem sufficient, should the eastern market come to recognize that our standard fruit was all of one grade and of known high value so that the box need only be marked "Grown in California, Standardized," to insure the best price in the market, still such a mark would rob each locality of its credit and the praise due to certain local conditions. It might tend to deprive us of local competition which is a healthy thing when rightly handled. "Grown in California" might not put Tokay grapes grown in Fresno on a par with Lodi grapes of the same name, or Elberta peaches grown on river bottom land on a par in point of color, size and flavor with this glorious fruit as it grows where I live. So it seems fitting for the sake of the locality and the home spirit that each district should have its own label of standardization and that this should be a registered trade mark. I am firm in the belief that if our various associations will adopt such labels they will find in a few years that their most valuable asset will be their trade mark. This label should be distinguished by something characteristic, local if possible. The highest thing in our part of the state is old Mount Shasta, and so as typical of our highest ideals in fruit we use in our label of standardization on a picture of Shasta the slogan "Shasta Quality." This does not interfere with private brands and is certainly a distinguishing mark. It is needless to say that such an association trade mark should be a good looker, something that will catch the eye at once and compel attention and one likely to remain in the mind. For this reason commonplace phrases should be avoided. If your association has not yet adopted a trade mark do not do so until the matter has been thoroughly studied, until you know what you want and have the right thing. Go slow, but go.

Standardize Railroads.

Standardization will naturally mean organization, and organization as it gains numbers and weight will mean influence, power. There may have been a time when there was no weight or influence comparable to the power wielded by your one railroad of those days, but with the coming of other roads and the breaking up of the old-time one-man power in California politics, we can see the time coming when organization will have not only weight and influence but actual power. In this way we should be able to standardize the railroads. By this I mean to bring them up to the standard of just treatment of the fruit trade from which they take all they can get, but to which they will give only what is forced from them. We do not hesitate to tell our packers what to pack because we know their business, and when we are strong enough we can so acquaint ourselves with the situation that what the railroads will grant from no other motive we can use our power to compel. If such a thing is right and it is possible to lower rates, it will soon be up to the roads to show us why we shall not have them.

Standardized Associations.

Right here let me express the hope that there may be formed at once a league of standardization associations to set in motion some of this work. Delay will simply mean to let slide along conditions that are notoriously bad. There is no time like the present while the iron is hot and before any action sets in our state political condition. Let us go to it and organize a state league of fruit growers associations on a basis of universal state-wide standardization.

Standardized Market.

The market with its selling agencies and consumers will give us little worry if we are right at our end. They want good fruit and the best we have is none too good. We must live down our past, but we can do that quickly if we do it together. There is no scapegoat upon whom the blame can be laid. So let us set our high standards, provide our trade marks and teach the dealers and consumers that all goods so marked are absolutely dependable, and I am sure that it will not be long before it will come to be known that the label on the end of the fruit boxes is as dependable as the brand on the head of a keg of nails. We cannot standardize the consumer. His ideas of fruit are drawn from his ideals. Your best will only excite him to want something better, but he will pay you top prices for top quality, only do not try to fool him any longer. Treat him as you would have him treat you and you will get down deep into his pocket.

Have I seemed to digress from my topic of "Growers and Packers of Standardized Fruit" and made it Standardized Growers and Packers of Fruit, and then taken the further liberty of introducing much about other allied interests? Well you know that back of the grower is the ground and that on top of the packer is the railroad and it is necessary to pry off the latter and dig the subject from the former. This I have tried to do by standardizing each part so that the whole might be presented as a single harmonious theme. And now in conclusion I take the liberty of pre senting to our state horticultural commission, the deputy commissioners in the counties, to chambers of commerce and fruit associations as they may be best qualified to do the work, the following suggestions:

First, to provide each community with an exhibit of those horticultural and agricultural products best suited to its locality so that the local standards may be known.

Second, to provide each community with a collection of insects, exhibits of plant and tree diseases, types of pruning, etc.; also for reference and circulation a full library of state and U. S. bulletins and some useful horticultural reference book; and where practicable to have introduced into the public schools courses in agriculture.

Third, that each fruit association should provide itself with a trade mark label of standardization.

Fourth, that a league of fruit associations be formed to deal with such problems as universal standards, railroad freight rates and icing charges.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

ALFALFA.

By Mrs. M. E. Sherman.

Soils in California are not usually sour nor deficient in lime, and these two facts are not of much importance in considering the planting of an alfalfa field. The water table rising and falling in the irrigated portions of the state is often a detriment. I would hardly expect a good lasting stand of alfalfa on land where the water table was nearer than three feet from the surface at any season of the year. With water four feet from the surface the alfalfa does not require irrigation after the first season, while land that is eight or ten feet to water with surface irrigation, is best for alfalfa of all the land that we have in the state. The medium lands, not too sandy nor too heavy, give the best satisfaction in handling the crops. Now this is not saying that alfalfa will not grow on a large range of soils and with irrigation on soil much farther to water and also produce on soils that are more water filled. Alfalfa, like the human race, has had a variety of conditions to meet and has a wonderful adaptability to natural conditions. Under ideal conditions it is called a fifty year perennial, but there is little that reaches that age. The changeableness of the human mind in California would alone prevent it.

Poor Methods.

The poorest way to start to grow alfalfa is to sow it directly on shallow plowed grain land. Moisture must be stored in the land before the seed is sown if the stand is to be a good one. The young plants do not bear irrigation well until the soil is at least covered and shaded by their growth. Season has less to do with securing a good stand than the ways of the farmer. "I wonder what would happen if we did not have the weather to blame for our careless ways of farming. Now naturally one would suppose that land just broken would contain all the plant food intact and the alfalfa would grow well from the very start. What, however, are the conditions we see all around us here? The old vineyard or orchard has died out or has ceased to be profitable and up come the trees and vines and in goes alfalfa into soil that should be considered impoverished by long cropping. The soil, however, has been turned over and over, year after year, and has stored moisture and sunshine into its very heart. The alfalfa grows rapidly and the field looks like a picture, so even and perfect that one wishes he could remove it bodily to the dooryard for a lawn. Now if this is the condition that a perfect stand of alfalfa demands we must make it by proper plowing on the land to be planted.

Preparing.

The best preparation of the soil is to begin a year before and grow corn or some other crop that requires constant cultivation and irrigation. As soon as the corn is off start in and plow deeply, twenty-four inches is not too deep to try for. Of course, without constant watching you will not secure over twenty inches. Here the great thing is to secure a good tool. I use the old sulky plow, others are using the newer disc plows with six or eight good horses to do this work. Harrow smooth or cultivate out the roughness as quickly as possible. I mean by this do not wait until a great stretch of land is done before going over with the smoothing tools to secure fineness. This tearing up and smoothing over the lumps is the preliminary work before leveling and checking. It will cost about four dollars an acre to do it right. It is well to consider here that alfalfa is not a cheap crop to put into the soil and the true economy is in doing it well at first rather than trying to do too much in a slipshod way. At this time a light sowing of gypsum on the surface will work into the ground thoroughly, about four hundred pounds to the acre is ample. Then square off the land into plots and check it up. If possible by having the lines of the checks staked off with small stakes some of the dirt can be moved directly into the low check lines. The necessity of plowing all the land before checking must be considered as the checks or levees if placed on unplowed land will seep under. The land or hollows that are filled directly on an unplowed surface form spots that the alfalfa will die out on readily. It is a common error in this work to make the land all level at first and then try to check it afterwards. I have come to believe that the less dirt moved the better. The unaired soil comes up and the stand is less good than though it was unscraped.

Cost of Leveling.

The question is often asked what is the cost of leveling and checking a piece of land. A question like this can hardly be answered except by saying it depends on the place and the land. Labor in California is not as well distributed as it is in the older countries. I often find from visitors on the demonstration train runs that laborers are receiving much higher wages in Southern California than is necessary to pay with us. The men themselves tell me that in the valley a man does his regular day's work as a teamster and stops, while the conditions in the South on the smaller places are like those in the East, a certain amount of chores are done after supper and before breakfast. The housewife often does the cooking and the food is more dainty, but not so satisfying as the more hearty food the Chinese cook prepares for the heavy eaters. How they can eat! The outdoor work gives them appetites that require three heavy meals a day. As a rule the cost of leveling and checking alfalfa is about ten dollars an acre in this neighbodhood. After the land is checked, again plow all the scraped spots deeply and if much land has been removed from them put on before plowing a liberal coating of barnyard manure. I like to put on manure from alfalfa fed stock, as it inoculates the land thoroughly. The checks should be low and broad and then they can be sown with alfalfa and the mower will cut them as perfectly as it cuts any of the rest of the land. The land is loosened now ready to soak in the first

A Good Judge of Cows

is likely to be a good judge of a cream separator. The same quality of brains that enables a man to breed high-class dairy cattle, leads him to buy the best cream separator.

It is worth noting that the man who produced the World's Record Holstein cow
COLANTHA 4TH'S JOHANNA,
has a United States Cream Separator. This man is W. J. Gillette, of Rosendale, Wis.

And do you know that the owner of
JACOBA IRENE,
the great record-breaking Jersey cow, A. O. Auten, of Jerseyville, Ill., uses the United States Separator on his farm?

Also the owners of the wonderful, $10,000 Guernsey cow
YEKSA SUNBEAM,
the Riedbrock estate, of Helendale Farms at Athens, Wis., use four United States Separators on their farms.

TWILIGHT LONAN,
Chas. L. Hill of Rosendale, Wis., owner of the celebrated Guernsey cow Twilight Lonan, uses a United States Cream Separator on his farm.

LORETTA D.
F. H. Scribner, of Rosendale, Wis., who developed the celebrated Jersey cow Loretta D., and who is one of the great Jersey breeders of the country, uses a United States Cream Separator.

If the **United States Separator** is the separator for these business men and thousands of others, leaders of the dairy world, **why not for you?** These experts—men who know, and do—require the use of a separator which **skims closest, washes easiest, runs easiest, and wears longest.**

This is the reason they all choose the United States Separator.

Send for Catalogue No. 20 today.

The United States Separator holds World's Record, therefore is the **World's Standard** Separator.

rain and sprout all the weeds and foxtail seeds in it. When the weeds have started well, plow them under, say in January or earlier if possible. This plowing may be done with ordinary plows and it does not require very deep culture, enough to turn the grass and weeds under. If plowed early enough the second crop of weeds may be secured as well as the first. Weedy land is one of the problems that has to be met in the young alfalfa and often proves rather serious in controlling. If they can be disposed of by allowing them to sprout and turning them under, it is probably the best way to proceed. It is always easier to get rid of unwanted plants by following up their life history closely. At the time a plant is just growing toward the blossoming period it is more easily destroyed. Just at blossoming time all the strength has been thrown into the bloom and that is the period when the plant is weakest in its power to renew itself from its roots. This applies well to bronco grass and to "chuckalootie." Foxtail and cockleburr are not as readily controlled at this time. The foxtail does not advance rapidly enough and the cockleburr is a wise chap that does not carry his eggs all in one basket. The burr contains more than one seed cased in an oily protection that may sprout after several years in the ground.—M. E. Sherman.

PRIMER ON BOVINE TUBERCULOSIS.

A catechism on bovine tuberculosis is a suggestive title of a circular of information written by Dean H. L. Russell and Prof. E. G. Hastings and issued by the Agricultural Experiment Station of the University of Wisconsin. This circular presents over sixty questions gleaned from the inquiries received at the college with brief answers based upon the best scientific knowledge of tuberculosis, the tuberculin test and best methods of controlling tuberculosis in a diseased herd. By studying this circular carefully, the stockman and farmer will be prepared to pass an examination as a tuberculin tester without difficulty.

No space is given over to arguments in detail as to reasons for the answers since these would involve lengthy technical discussions of no value to the farmer. These answers prepared by two specialists of national reputation need no farther endorsement.

The following questions and answers give some idea of the scope and character of this circular, which is distributed upon request by the Agricultural Experiment Station at Madison.

What is tuberculosis? A transmissible disease caused by a specific kind of bacteria. The organisms leave the body of the diseased animal in various ways and enter the body of a second, healthy animal.

What animals have tuberculosis? All warm blooded and some cold blooded animals. In the northern portion of this country it is the most important disease of cattle. Of the domestic animals, cattle, hogs, and fowls are most often affected; sheep, horses, dogs and cats but rarely. Most of the wild animals in captivity die of tuberculosis.

Is one breed of cattle more susceptible to tuberculosis than another? Cattle of any breed, beef or dairy, acquire tuberculosis easily and quickly, when once brought in contact with diseased animals giving off tubercle bacilli. The reasons why more dairy than beef cattle have been found to be affected is because of the much greater interchange, the longer period for which they are retained, and the closer confinement to which they are subjected.

How is the disease introduced into the herd?

1. By the purchase of diseased animals.

2. By feeding mixed factory by-products, such as raw, creamery skim milk and whey.

3. By direct contact with an affected animal.

What per cent of domestic animals have tuberculosis? It varies widely in different countries and in different parts of the same country. From July, 1908, to July, 1910, over 90,000 animals, largely milch cows, were examined for tuberculosis in Wisconsin and about five per cent were found to be diseased.

What is the tuberculin test? If tuberculous cow has a small quantity of tuberculin introduced beneath the skin, a temporary fever will result, which can be detected by taking the temperature of the animal; a healthy animal shows no such fever.

Does the use of tuberculin injure animals? Tuberculin has no ill effect whatever on healthy animals, and no harmful effect on tuberculous animals. It does not, in the amounts used in testing, have any effect on the progress of the disease in the animal, nor can it in any way produce the disease. With many of our best herds it has been used regularly for 10 to 15 years with absolutely no injurious effects. The statements that the test causes abortion or other ailments are without foundation. The flow of milk is not changed to an appreciable extent, even in the case of tubercular animals.

How can a diseased herd be freed from tuberculosis? Test the whole herd. Remove all reacting animals. Retest all suspicious animals in three months, and the entire herd again in one year and annually thereafter. Disinfect the stable.

How can a herd be kept free from tuberculosis? Test annually or at

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

least every two years, and retest all suspicious cases in three months. Test every animal introduced into the herd at the time of purchase, and again in three months. Use a farm separator or feed only skim milk and whey that have been heated.—Wisconsin Agriculturist.

THE BEST WAY TO DEHORN.

Cattle are most easily dehorned during calfhood, says a Canadian Bulletin. Caustic potash is the usual agent employed, while lye does a satisfactory job. The action of these agents when properly used is to destroy the life of the horn in its early stage, rendering the treated animal a smooth-headed beast, deprived not only of the instruments of defense, but to a large extent the inclination to bully its mates. Dehorning by potash or lye is done before the animal is ten days old or as soon as the button-like embryo can be located on the calf's poll. The hair surrounding the spot is clipped off and the parts moistened with soapy water. When using the potash in the stick form it should be wrapped in paper to protect the hand and an exposed end moistened and rubbed gently on the buttons in turn for about five minutes or until they become sensitive and red, but not to the extent of bleeding. Care must be taken that the dissolved potash does not run down the side of the head, or the skull may be seri ously burned and permanently disfigured. If carefully done a scab soon forms, healing follows and the spot becomes covered with hair from the surrounding part. With some calves the operation may be done at four or five days of age while in others it is necessary to defer the operation for a few days longer. If treatment has been neglected until the calf is two or three weeks old the horns may yet be killed with lye. The preparation of the lye is the same as for caustic potash. The powder is moistened and worked into a paste which is applied and rubbed well in with a knife blade or piece of wood. It is a safe practice to apply grease or oil to the skin around the horn to protect those parts from the action of the lye, but no oil should touch the part to be treated. The calf dehorned by either potash or lye should be kept from getting wet during three or four days following treatment so that the dissolved caustic will not run down and burn the skin. The calf will suffer some pain for an hour or two, but no other inconvenience is experienced. Treated calves should be tied separately so that they cannot lick each other.

Horned cattle not treated while calves may be readily dehorned by either an ordinary meat saw or dehorning clippers. The pain of such operation has been over-estimated and the mortality is practically nothing. The exact loss of flesh due to excitement, loss of blood and pain, is difficult to estimate, as very much depends upon the skill of the operator, and perhaps more still, upon the temperament of the animal operated upon; nervous, irritable animals, suffering a greater setback than quiet, sluggish ones. In any case the loss is seldom great.

It is not advisable to dehorn during fly time.

COLDS IN HORSES.

Changes in the weather cause the horse to contract a cold. Lack of care during the cold weather also adds to the causes, such as leaving the horse standing in a cold wind while warm and unblanketed.

The cold is usually manifested by a mucous discharge from either one or both nostrils, a staring coat, general depression, slightly off feed, bowels constipated and scanty, high colored urine. These symptoms become aggravated as the disease progresses. The mucous discharge takes on a more sticky appearance, and the cough is quite frequent when the horse is exercised.

The cold may extend into the throat, causing considerable soreness, as is shown by the horse protruding the head, tenderness from manipulations of the throat, and frequent coughing.

If the cold is neglected, it becomes chronic, and may last for months. In this condition the animal loses flesh, the coat remaining rough and good feed apparently doing the animal no good.

Preventive treatment is, of course, much easier than medicine. One should keep the horse out of draughts while warm. Blanket the animal during cold weather while in the stable. If obliged to work the horse during rainy weather or in severe storms, a canvas blanket to keep the horse dry is necessary.

Medicinal treatment consists of steaming the nose, using a pail of hot water to which is attached a sack, the other end being cut so as to allow the steam to enter the nose of the horse. A pint of raw linseed oil, to open the bowels, is beneficial. A hot poultice of linseed meal applied to the throat will relieve the tenderness there. When the patient begins to improve a course of better tonics is indicated.—C. L. Barnes, Colorado Agricultural College.

Why DE LAVAL Cream Separators Are Best

De Laval the Logical Leader

It is not due to any mere stroke of luck or freak of circumstances that the De Laval Cream Separator has maintained first place in the esteem of cream producers ever since its invention in 1878. There is a reason for everything if we but know it, and there are many reasons why the De Laval is now and always has been the best cream separator.

De Laval the First Practical Separator

Dr. De Laval invented the first successful continuous cream separator because he had worked harder, was better informed, and knew more about the centrifugal separation of cream from milk than any other man who attempted it.

Starting with this advantage the De Laval Company has maintained its lead in the improvement and development of the separator, step by step from year to year, because it has always had an organization better equipped in every way to build the best separator than any one or all of its would-be competitors combined.

World-wide De Laval Organization

The De Laval organization extends the world over, with a number of the finest and largest shops in the world in America, Sweden, Germany, France, Austria, Russia and other countries. Every one of these shops is devoted solely to the building of separators. Their manufacture is not simply incidental to that of something else, as is the case on the part of every would-be competitor. No other separator shops compare with them in size, equipment or volume of production. They produce more separators in a day than any competitor in a week or most of them in a month.

De Laval Designers Most Experienced

The De Laval organization of separator scientists, experts, engineers, designers, practical manufacturers and skilled workmen of all classes, not only in one country but a half dozen, is unapproached by all would-be competitors combined. The De Laval Cream Separator as we know it today is the composite production of these men of many shops and many countries, the amalgamation of the longest and best separator experience in the world.

All Important Cream Separator Patents Controlled by De Laval Company

Moreover, the principal features devised in the construction and development of the De Laval machines have naturally been covered by patents, numbering several hundred in all, so that, however great their knowledge of De Laval machines, would-be competitors have been compelled to utilize means of construction which would avoid infringement of these patents, and thus forced to adopt less efficient and less desirable methods until certain De Laval patents had expired, by which time the construction covered by such patents had been discarded and abandoned or further improved in the course of De Laval progress.

De Laval Used Almost Exclusively by Creameries and Butter Factories

That, briefly, is why De Laval Cream Separators have maintained their supremacy, regardless of one competitor or another, increasing their sale year by year until their already nearly universal use in larger sizes by creameries, butter factories and milk stations is rapidly becoming as general in the farm and dairy likewise, and for the self-same reasons.

A De Laval catalog or any desired separator information will gladly be sent for the asking.

CONTENTS THIS WEEK

IRRIGATING SYSTEM IN SUNNY STANISLAUS, Cover.
STANDARDIZED FRUITS, 515.
CITRUS AND TROPICAL FRUITS.—Widening Horticultural Horizon; Alkali from Nitrate of Soda; 516, 517.
DECIDUOUS FRUITS.—Storage in Transit; Raisin History; Apricot Output; 518, 519.
GARDEN AND FIELD CROPS.—Bean Weevil; 520.
HOME GROUNDS BEAUTIFUL.—Chrysanthemums; 521.
LIVE STOCK AND DAIRY.—Alfalfa; Primer of Bovine Tuberculosis; Best Way to Dehorn; Colds in Horses; 523, 524, 525.
EDITORIAL.—Answers to Queries.—A Thousand for a Rose; Agriculture in Rural Schools; Rock Phosphate; Agriculture Wins; Editorial Notes; 526.
AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 527.
PRACTICAL POULTRY CULTURE.—Bringing Up the Babies; 528, 529.
IRRIGATION AND FORESTRY.—Irrigation and Dairy Industry in Stanislaus; Interesting Meeting of Tulare Grange; Pecan Planting; Alfalfa Notes; 530, 531.
QUESTIONS AND ANSWERS.—Angora Rabbits; Bones for Poultry; Cypress in Arizona; Locust for Fence Posts; Fertilizer on Alfalfa; Laying out Orchards; Novel Leveler; Flea Beetles; Wooden Silo; Bamboo for Turning Stock; White Minorcas; Cow Falling Off; Withertip; Tariff on Lemons; Dieback; 533, 534.
VETERINARY.—Elephant Leg or Glanders; Caked Udder; Scours; Debility in Cow; Warts; 535.
TIMELY RANCH SUGGESTIONS.—Ferrets; Breeding Cotton; Alfalfa Banquet; 536, 537.
HOUSEHOLD.—To the Meadow Lark; Lucile's Diary; Raisins; Manners at Home; 539, 540, 541.
PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market, 542, 543.

ANSWERS TO QUERIES.

We have spoken of the effort sometimes required to secure information for inquirers who appeal to the question and answer department. We have referred to the necessity, or at least urged the advisability, of giving us the fullest particulars, that we may give the most intelligible and helpful answers, yet last week came one query in which eye trouble is mentioned, and the only clew to the kind of animal affected is expressed by the word "she.' This, of course, was an oversight on the part of the subscriber.

The object at this time is not so much to refer to this feature of the queries as to the very many appreciative letters received recently. Several subscribers have written regarding the help they have received from these answers, and we mention it not to suggest other similar letters, but that we are more than glad to render this service. This question department of the Cultivator always has been one of its strongest features, and we wish to make it still more so, and to that end ask our friends to use us.

A THOUSAND FOR A ROSE.

The management of the Panama-California Exposition at San Diego is pushing preparations for the great fair four years later. The grounds are already being planted, and the latest move is the offer of $1,000 for a new rose as a special ornamentation feature. Competition for the honor of supplying this new rose is open to any nurseryman or other in the United States. The name of the new rose shall be "San Diego," and there are three restrictions. The first is that the rose must be hardy, so that it can be easily grown outdoors. The second is that the competitors must be residents of the United States, and third, they must make known their intention to compete to the San Diego Floral Association. The management is putting forth every effort to make the grounds and their planting typical of everything that is best on the Pacific coast.

AGRICULTURE IN RURAL SCHOOLS.

The agricultural college of the Ohio State University has issued for some years what it calls an extension bulletin, a little six by nine monthly, for distribution to school children of that state, that aims to create interest in agriculture and, more, to direct original research. The issue for February gives place of honor to description of how work may be taken up in rural schools, with illustrations of various experiments and with boys' work in growing certain field crops, especially corn. The testing of seed is described at length. Photographs are shown of collections of harmful insects and of children who have made experiments. Poultry and fruit are also treated.

ROCK PHOSPHATE.

Florida produces more phosphate rock in proportion to its size than any other section of the world. Its principal rivals in production in the East are South Carolina and Tennessee, whose production is materially declining, while that of Florida has increased largely during the last six years. Regarding its output the state geologist reports "the phosphate rock output of this state for 1910 at approximately 2,029,797 tons. One peculiar fact about this great increase in the amount mined in Florida last year is that it is altogether in the pebble section; the output of hard rock having actually decreased during the year, owing to the depression in the phosphate market. Another peculiar fact is that the amount shipped during the year to domestic and foreign consignments exceeds the increased amount of that mined, and this excess of shipment over production was due to the shipments of hard rock exceeding the production of the year by nearly 100,000 tons." Other sections of the United States now give promise of becoming great phosphate producers. It is one of the serious problems confronting the farmer as to whether this element in our soils can be permanently supplied.

AGRICULTURE WINS.

We have referred heretofore to the fight of the farmers of Shasta and Tehama Counties against the smelter people, who have permitted the escape of poisonous gases which have made impossible profitable agriculture in that section. The fight was carried into the courts and an injunction secured against the smelters. More recently, orange growers at Colton, San Bernardino County, began an action against the California Portland Cement Company, which was operating a million-dollar cement plant near their groves. The action was started because of the great quantities of dust allowed to escape from the cement mill, which spread over the groves and coated each leaf until it was unable to perform its functions. This resulted in a lowering of the productivity of the orchards until orange growers saw only ruin before them unless the manufacture was stopped. The superior court of San Bernardino County granted an injunction, also awarded damages to each orchardist. It is understood that the matter will be carried to the supreme court, but as yet the victory lies with agriculture.

A canner has made the statement that if he could purchase green corn for canning in this state he could sell 100,000 cases every day. There are now imported from Eastern states over 200 carloads of canned corn annually. Much of this corn comes from the state of Maine, some from Indiana, but the question arises, may it not be produced within our own borders? It is not probable that it will be done in the near future, but ordinary field corn has been selected which is doing fairly well and proving profitable to some farmers. May the same not be said of canning corn, and may we not yet find success along this line?

The Council of North American Grain Exchanges of Chicago is taking an advance step in the matter of crop improvement; it has a crop improvement committee, the duty of which is to induce more careful selection and testing of grain seeds. One of its suggestions is that the education should begin with the younger boys and girls in the schools. We doubt not the pamphlet, "How to Obtain a Large Yield of Wheat" is full of information and will be sent for the asking.

The value of farm land in the state of Colorado has increased during the last decade over 300 per cent. During the decade the number of acres in the average farm decreased 24 per cent. The number of farms in the state is 45,839, an increase of 86 per cent.

Vineyardists of the state have seldom prepared for protecting their crops against the ravages of Jack Frost. In fact, California conditions are so nearly ideal that as a rule there is no need of such preparation, but this year proved the proverbial exception, and the raisin crop and wine grapes of the central and northern part of the state have been largely reduced. We are not informed as to whether the frost was so severe that the ordinary methods of frost protection would not have availed, but assume that ordinary preparation would have saved the crops. Frost protection is cheap insurance, and while seldom needed, its need is very urgent at times.

The winter wheat crop the country over promises somewhat better than last year. Last year's condition at this time was represented by 80.8 points; this year by 83.3; the spring of 1909 by 82.2. Conditions for the past ten years average 86.9 points. There is a slight improvement noticed in reports from December last up to the present time. This is favorable compared to the ten-year average for that shows a dwindling during the same months of 4.04 points. There is also a falling off in condition from December 1st up to this time of two points.

The appropriations granted by the last legislature in aid of agricultural research should add materially to the possibilities of this state. The pathological laboratory at Whittier is planning for investigations in celery blight and other problems which should greatly enhance the value of that product. Other matters will be handled by the central experiment station at Berkeley. These, with the cereal experiments in charge of Prof. Shaw, should greatly aid farmers in solution of the problems before them.

A meeting of a postal progress conference is being held at Washington this week, and the principal topic discussed is "An Extended Parcels Post." Residents of the United States pay 16 cents a pound up to four pounds. Europeans may have parcels mailed from any office in the United States to most offices of Europe at the rate of eight cents a pound up to eleven pounds. This discrimination against Americans by the Postal Department arouses demand for radical change and more competent business methods.

Bulletin Number 203 has to do with importance and improvement of the grain sorghums. The aim is to show the importance of such sorghums as milo, durra, kafir and kaloing. These are primarily grown for the grain they produce though the kafirs, of course, are largely grown for forage. How to secure more of both grain and forage is taken up at length in this bulletin.

At a recent fruit growers convention, in referring to the changes sometimes necessary in the industry the remark was made that we should "go slow, but go." Sometimes the change is not for the better, but the wise man opens his mind to see wherein he may at every turn in the process of production improve his product and benefit himself, so while it may be wise to go slowly at times, we should not be content with going so slowly that it is not possible to detect any motion.

Agricultural News Notes of the Pacific Coast

Northern California

Several tracts at Wheatland, Yuba County, are being subdivided.

Gridley, Butte County, gathered its first strawberries on Monday, April 10.

Egg producers and dealers of Santa Rosa are still determined to secure just returns in the general market.

The Napa County Paultry Association has fixed upon the dates of January 4 and 5, 1912, for its next poultry show.

Potato growing is increasing materially in Grass Valley, and some of the finest quality in the state is produced there.

A consignment of 14,000 baby chicks was made to the southern part of the state last week by the Bihn Hatchery of Petaluma.

The last state legislature set aside $8,000 to be used by the state experiment station in investigations of hog cholera serum.

A rice expert of the Department of Agriculture is investigating soils and conditions of San Joaquin County with reference to rice culture.

Prof. Shaw of the Experiment Station staff has been granted a $15,000 fund with which to make more extensive experiments with cereals.

A farmer at Redding, Shasta county, will plant 25 acres of southern sugar cane and thinks he can make a complete success of it in that section.

A committee of wine producers at St. Helena, Napa County, are making preparations for a vintage festival to be held during the first of August next.

Most cherry-growing sections of the northern part of the state report about 30 per cent of a crop; peach crop will be about average; prunes and figs heavy.

A tract of 13,000 acres near Corning, Tehama County, is being subdivided, and $10,000 expended in the construction of streets and boulevards.

The Wheatland Chamber of Commerce is discussing the matter of an experimental farm, the idea being to demonstrate the benefits of intensive farming.

One nurseryman at Gridley, Butte county, follows the plan of giving trees and ornamental shrubs free to the schools; also to the widows in the community.

A section of 10,000 arces of land in Yolo County is being reclaimed by the construction of levees. The improvement will cost $100,000. The section is called West Sacramento.

The Apple Growers Association of Sebastopol, Sonoma county, has consolidated with the Sebastopol Apple Growers Union. This brings practic ally 85 per cent of the growers under one management.

Since the suspension of the Sonoma County Poultry Association's contract with the Produce Company the Santa Rosa produce dealers have advanced quotations on first-grade eggs to regular San Francisco prices.

There are over 5,000 varieties of grains, grasses, trees and shrubs being developed at the government plant introduction gardens at Chico, Butte County. These are from practically all sections of the world.

Central California

The Kerman Melon Growers Association is about to disincorporate.

Several timber land claims have recently been filed in the Tehachapi hills.

Apple growers of Pajaro Valley are discussing the formation of a better method of marketing apples.

San Joaquin county reports grain in most excellent condition and big promise in both hay and grain.

It is claimed that over 100,000 orange trees have been set out in Kern County during the past six weeks.

Salinas potato growers were hit hard by the frosts, which greatly reduced the output of early potatoes.

Profiting by last year's experience, citrus growers at Lindsay have made a more persistent campaign on the orange thrips.

Fresno County, while not classed with the larger citrus-producing counties, is now sending out not far from 200 cars yearly.

County Horticultural Commissioner Garden of San Joaquin County has decided to make a strong fight against the potato eel worm.

Fresno County Farmers Union has decided to maintain a raisin statistics bureau, which will be in charge of a crop report committee.

The frosts of April 12 and 13 ruined many early planted potatoes and watermelons and did material injury to all fruit crops, especially grapes.

The Pajaro Valley reports but little of the apricot crop injured by the cold weather and rain. Ten per cent of damage is the most liberal estimate.

County Bee Inspector Hennekin of Monterey County reports the promise for a big honey season the very best. Black sage has taken on a very heavy growth.

The Raisin Day Committee has forwarded approximately 10,000 letters to growers and hotel people of the United States, urging general observance of April 29.

Poultry raisers of Watsonville, Santa Cruz County, are planning an excursion to Petaluma, Sebastopol, Santa Rosa and other poultry centers north of San Francisco.

The dairying interests of Tulare county have been insisting on the appointment of a dairy inspector and the board of supervisors has finally granted their request.

Stanislaus County claims an increase of 25 per cent over last year in her dairying industry. The biggest individual purchasers of cream in the state are in that county.

Raisin growers are now holding last year's output at four and one-half cents, and some sales nave been made on a four-cent basis. One packer has sold some fancy seeded at seven cents.

It was feared at first that the citrus crop of Tulare County might have been injured because of heavy bloom at time of recent frost, but it is now reported that the promise is for the heaviest crop ever.

Fresno Chamber of Commerce has taken up the fight against the Zante currant. The grounds of the fight are the filthy methods of preparation of this fruit, which is practically a competitor of the Sultana grape.

Southern California

Coachella Valley will ship forty to fifty cars of Bermuda onions through the California Vegetable Union.

The Whittier Pathological Station will make special study of celery blight during the coming season.

The horticultural inspector at Beaumont, San Bernardino County, reports the inspection of 30,000 apple trees.

Oceanside is growing its first beet crop, and if successful it may result in an effort to secure a sugar factory.

A vegetable growers association has been formed to handle the products of the Yorba Linda section in Orange County.

Deputy State Commissioner Maskew has been investigating an aphis pest of barley near Oceanside, San Diego County.

Alfalfa growers are continually adding their names to the co-operative marketing organization which is being perfected.

Mr. F. C. Penner, of Escondido, San Diego County, gathered from one acre of orange trees 830 boxes of marketable oranges.

Canners are offering $7.50 per ton for tomatoes at Anaheim, Orange County. This is 50 cents in advance of last year.

The California Vegetable Union of Los Angeles is shipping onions from Brawley, Imperial County section, in carload lots.

The recently organized poultry association of Escondido, San Diego County, will hold another meeting on Saturday, May 6.

Hemet, Riverside County, reports thousands of acres of barley four feet or more high, with mowing machines about ready to start.

The sugar beet ranches in the neighborhood of Huntington Beach are in most excellent condition, and every promise is made for a big output.

Imperial Valley promises to ship 2,500 cars of cantaloupes this season; each car contains about 375 crates, and the hope is for a $2.50 price.

An artesian well on the base line near San Bernardino was struck last week and is now showing a flow of 200 miner's inches. The well is 650 feet deep.

San Diego is planning a great celebration for July 19-22, at which the formal services of breaking ground for the Panama-California Exposition will be held.

The agitation which was taken up last week for the securing of the sugar beet factory at or near Perris, Riverside county, is being renewed, and eighty acres has been deeded to the company for its site.

Southern California is shipping strawberries as far north as Montana, Wyoming and Idaho. A reduction of 25 per cent by the express companies is responsible for the increased shipments.

The water conservation association which has been diverting over 20,000 inches of water from the Santa Ana River to gravel beds, from which it will later percolate into the stream and be used for irrigation purposes, has turned the water back into the river and ended the campaign for this season.

The Coast

La Crosse, Washington, reports largest acreage of wheat ever planted.

Extensive sales of pure-bred draft horses have been made to live stock raisers at Pullman, Washington.

Arizona live stock raisers report ranges in best of condition, with cattle being sold off closer than usual.

The Oregon Agricultural College at Corvallis has a force of six experts investigating fruit pests of the state.

Five acres of land in the Tieton irrigation district, in Washington, have been set aside for experiment station purposes.

Sheep shearing has been finished by farmers at North Yakima, Washington, and over 20,000 sheep have lost their coats.

A meeting of the stockholders of the National Wool, Warehouse and Storage Company was held in Salt Lake City last Friday.

Work is being pushed on the main canal which will carry water from the Laguna Dam to the siphon under the Colorado near Yuma.

Apple growers at Lewiston, Idaho, claim the use of fire pots in orchards saved thousands of acres during the frosty nights of April 12 and 13.

Wool buyers near Pendleton, Oregon, have fixed upon dates for wool sales for May 23 and June 9; at Pilot Rock the sales will be on May 26 and June 10.

One of the largest currant-producing sections on the coast is at South Bend, Washington, but early April frosts have practically wiped out the crop for this season.

The Inland Empire of Eastern Washington was visited by severe frost on the night of April 12; some fruit was killed, but frost protection measures saved much of it.

A meeting of Montana stock and sheep men was held at Miles City, Montana, last week. The meeting was the twenty-fifth annual of the Montana wool growers.

Large labor employers of the Hawaiian Islands are in arms because canners and others requiring labor in California are taking away many of their most efficient laborers.

Some farmers of the Northwest have determnied to compete for the $1,000 cup offered by the President of the Milwaukee & St. Paul for the best oats produced in the United States.

The reclamation service reports the season as most favorable to the Truckee-Carson project, in that the rainfall and the depth of the snow assure abundant water supply.

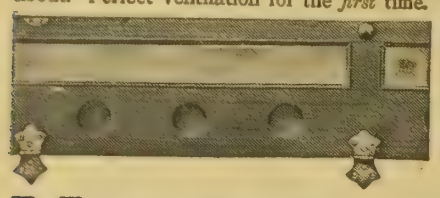
Meters are being placed upon the water supplied to some orchards near North Yakima, Washington, by which a test can be made of the amount of water required for each row in the orchard.

An irrigation expert from Colorado is being employed to outline an irrigation scheme for the John Day Valley near Canyon City, Oregon. The scheme proposes to bring 30,000 acres under the ditch.

The Southern Arizona Agricultural Fair Association at Wilcox has empowered a committee to proceed with the sinking of a well on the fair grounds to the depth of 2,000 feet, the cost per foot being $2.50.

More Inventions by Lee

Here's his new Incubator door all are talking about. Perfect ventilation for the *first* time.

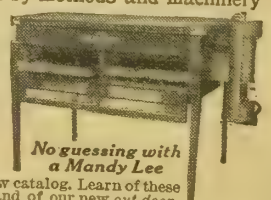


Mandy Lee Incubators

supply life-giving oxygen freely to the eggs and just as naturally draw off the poisonous gases. The most important step ever taken in incubator ventilation—neither above nor below, but *right at the eggs*—the correct principle, for the new Mandy Lee is making better hatches of *stronger* chicks than any other incubator in the world.

We Measure Everything

Heat—moisture—ventilation. You *guess* at nothing. If the eggs are good and you follow simple directions your work with a Mandy Lee is as nearly an absolute certainty as anything can be. There is no more reason why you should buy an incubator that regulates nothing but heat than for a farmer to continue to harvest his crops by methods and machinery used 100 years ago. Your success with poultry depends on your ability to select equipment that is *right*—that's what you *always* get from us.



No guessing with a Mandy Lee

Send *to-day* for new catalog. Learn of these new improvements and of our new *out-door, lamp-heated* and *regulated brooder*, just what is needed.

Practical Poultry Culture

BRINGING UP THE BABIES.

By Mrs. A. Basley.

"Do give us a talk on how to bring up the little chicks," pleads one of our sisters, "and don't be late this year for some of us need help."

Nothing is more interesting than a brood of little chicks unless it is a brood of little ducks. Nature has endowed young life with the propensity to grow, to develop and to mature. Little chicks if they are the progeny of healthy parents, have this propensity very strongly, they will grow if they have half a chance. They will grow if they have the proper food, the proper exercise and cleanliness, or I might call it the proper care.

The decalogue has more "Thou shalt nots" in it than commands to do certain things and I sometimes think instead of telling what to do to bring up chicks we might say "thou shalt not," so today I will suggest a few "don'ts" in the bringing up of the chicks.

Grandmother's ways were undoubtedly good, but grandmother was "terrible clean," and here is the difficulty with raising most of the chicks in this climate: Don't let the lice get your chicks or your little ducks that are being mothered by a hen. Head lice have caused the death of many a chick and many a duckling. Look for them and powder the little heads frequently with buhach or put a wee bit of lard on the top and under the chin, not much grease, for grease will make the chicks sick. A wee bit of carbolated vaseline does well, or some advise a drop of sassafras oil, but I prefer the California buhach powder. It is called pyrethrum in the East and is made from a certain daisy. It is perfectly harmless to animals, but is death to all insects. I have used this powder for many years on the smallest canary and the largest turkey, and it has never failed to destroy the insect vermin. Of course, there are other insect powders which are effective and possibly a little cheaper, but I use none other on little turkeys, as it is the safest of all.

"Don't" feed the babies until they are at least thirty-six hours old. Nature has provided them with food that lasts for three days and if other food is given to them it is contrary to nature and will certainly do them harm. The food that nature gives them is the yolk of the egg that has not been entirely consumed during incubation and is usually about one-fourth of the entire yolk. It is drawn up into the bowel cavity through the navel the last twenty-four hours of the chick's life in the shell. If other food is given before this yolk has had time to be assimilated it will either retard the absorption of this or in some cases it will entirely stop it and the yolk will remain in the bowel cavity and decay there, causing blood poisoning. If the yolk is only retarded in its digestion it will so disagree with the chick that it will appear listless or sleepy, will be "stuck up behind" or have diarrhoea, and if this does not kill it its growth will be retarded and it will never be as sturdy and healthy as it otherwise would have been, and just because its baby digestive organs had been overstrained by feeding it too early in life.

I give my chicks water from the first and also let them pick the coarse sand just before giving them their first feed which with me is almost always rolled oats such as we use for our own breakfast, or cracked wheat.

"Don't" feed the wrong feed. Grandmother fed chopped hard-boiled eggs and Johnny cake or soaked bread. You cannot improve much on that, but do not feed wet mashes, even if you think that grandmother did, for wet mashes are hard for even grown hens to digest. I you ever are in doubt consult nature, our great teacher. Nature never gives her young chickens, or partridges or grouse or pheasants wet mashes. She gives them insects, grubs, worms, green tender leaves and grass, and some seeds. If we could feed just like that it would be best for our chicks, but as we cannot we must get the best substitutes that we can. Let us see what those are. The best substitutes for insects our grandmother used were hard boiled eggs and curd of milk. What can we substitute for those if we have them not? We can buy the granulated milk, or the dried milk. I think those are the two names that the new material is called. I have been told that it is made from the residue of the milk after the sugar has been taken out for medicinal purposes. At any rate the milk dried or granulated is greatly liked by chickens and it seems to suit them well. Then another substitute is what is called "beef scrap" or "beef meal," this is made at the packing houses from the leavings, lungs, heads, ets., boiled down, dried and ground, and is used largely for chicken feed.

Extreme care must be employed in selecting beef scrap. Good beef scrap (or meat meal) should not have a foul odor, neither be lumpy, or full of vegetable fiber. If the beef scrap is lumpy and the lumps show white in the interior it should not be fed to either young or old fowls. If there are no lumps and the scrap smells reasonably sweet, pour a little scalding water on some of it and if it still smells sweet and meaty you can feed it safely. Good, pure meat scrap can be fed safely, but I have had sad experiences and so warn others to be careful what they feed.

Chicks need more green food than they usually get here in California. I have found that lettuce is the best green food for chicks and next to that green clover or alfalfa, but for quite little chicks nothing is much better than raw potatoes chopped fine, and they relish them greatly if an onion is chopped up with them; also beets chopped up are good and it will pay to take the trouble to chop these vegetables up for the babies. Fresh meat also is very good. I always used to get Hamburger steak three times a week for my chicks when I had large numbers of them and that was as good a substitute for insects as I could find.

The old-fashioned plan of giving chicks mashes has been superseded by the chick feed. This is composed of a great number of small grains and it is more like nature's own food than mashes. Chickfeed is now compounded by a number of our best poultry supply houses. The foundation of all the chick feeds is wheat and corn finely cracked, with a number of small

Coulson's MADE IN PETALUMA

Special chick food

If nature hatches the egg, you should save the chick. And you can do it with Coulson's Special Chick Food—the greatest life-saver known in the chicken industry.

This food is the result of years of study to get just the right ingredients in a proper mixture to save the largest possible number out of every 100 chicks.

Coulson's Special Chick Food is an investment, not an expense. It pays big dividends by starting chicks on the road to profit for you. Costs about one cent a chick for four weeks' feeding.

Coulson's Growing Chick Food must be used after the first six weeks, to keep up the steady growth of the chicks up to three months, at which time they are old enough to use Coulson's Egg Food—the standard feed for laying hens.

At your dealer's or from us. Write for the interesting book, "Poultry Feeding for Profit." It's free.

grains added. The best of these is steel cut oats and rice; the others are simply to add variety. Oats and rice are foods that give vigor, that make bone and muscle and are extremely valuable in forming sturdy and large frames for the chicks. When I buy chick feed I take a cupful of it, spread it out on a newspaper and examine it and then decide what it needs, and add that. I never yet have failed to add steel cut or rolled oats to the feed, and sometimes rice.

Prize Winning White Orpington Hen at Los Angeles, 1911
Owned by A. W. Huskins, Los Angeles.

I feed for vigor and one of the best plans to get vigor is to coax the chicks to scratch. To do this I feed in chaff, or in alfalfa hay cut in half inch lengths in a clover cutter. This is spread over the floor of the brooder or in one corner of the run if they are out with a hen. It is surprising how much of the clover or alfalfa hay the little ones will eat and how they delight to scratch. Scratching will do a great deal for them; first it will develop their legs and thighs, it will broaden or lengthen their backs, it will develop their digestive organs so they will never have diseases, and it will make the egg organs or organs of reproduction vigorous and active so that when the chicks mature they will be ready to produce more eggs than their mothers. And lastly it will prevent the chicks from getting into mischief. Mischief? Having good deep chaff to scratch in will prevent the chicks from pecking each others feet, will prevent feather pulling and scrapping. Keep the chicks busily engaged in scratching to prevent leg weakness, knocked kneed, weak cockerels and to keep them all happy and busy. Try it and see for yourself.

"I never saw any one who fussed less about their chicks than you," said an expert who was staying some months with me. "Did you ever see any one have better luck?" said I. He shook his head and laughed. I had only lost one chick and that was killed by a cat, in those three months.

Exercise gives vigor. Vigor gives good digestion. Nature has fitted the chicken's digestive organs for digesting the food that nature gives and that is not ground up but is grains and seeds. If the organs that nature intends to grind up and digest the grains are not kept in use they become weakened and flabby. For this reason "don't" give mashes of wet and ground up food. Give the whole or cracked grains of the chick feed. Then the little gizzard will have to exercise and work and the chick will be vigorous. Some of the grains will be composed of the elements that are conducive to vigor and to making bone, flesh and muscle. The analysis of the different grains shows this. These grains should be the principal ones used in the chick food. The chick feed and rolled oats is my main feed until the chicks are six or eight weeks old, then I gradually add the food of the old hens.

My program is: breakfast at about six consisting of rolled breakfast oats or chickfeed, next green feed, lettuce or chopped up potatoes, then at noon chick feed, next green food and the last feed for supper is hard boiled eggs chopped fine shell and all mixed with dry bread crumbs and an onion chopped fine. Two eggs is enough for fifty chicks. If I have not bread crumbs enough I add Johnny cake, crumbled or rolled breakfast oats to the eggs and onion. I always send them to bed with their little crops full. The onion is a very good tonic for the liver and kidneys, for it prevents worms in the chicks and also prevents colds. I always try to give onion at least once a day.

When I feed the Hamburger steak I give it at supper time, and when I am feeding the granulated or dried milk I either mix it with the chick food or I put it in a small hopper or box and keep it before the chicks to help themselves.

I also give them sweet milk every day in a fountain and clean water several times a day. Fresh water will eliminate sickness. Warm water may not be exactly harmful, but it is a good medium or culture for germs. You can buy drinking fountains very cheaply at the poultry supply stores. I lately saw one made of a glass quart fruit jar with an aluminum little dish or saucer fitted on the cover, which I found excellent. I have also made drinking troughs from a tomato can by making a nail hole or cutting a V-shaped piece an inch deep in the

White Orpington Cockerel
Owned by A. W. Huskins, Los Angeles.

cans, filling the can with water as fast as the hole and then putting a saucer on it and quickly inverting the whole. The water will run into the saucer up to the hole just as fast as the chickens drink it. A bottle also can be filled with water and a wire bent and inserted in the neck in the form of a T to prevent it touching the saucer and the bottle can slip into a wire fastened to hold it to the fence post or side of the house. These are all home-made inventions if you cannot get the regular drinking fountains. The fountain for the milk should be scalded out every day and the water fountain frequently. A little care and cleanliness in these simple things spells "success," while a neglect of clean water is sure sooner or later to cause sickness and death.

Dwarf Milo Maize and Red Kaffir Corn

The two great drought resisters should now be sown. There is no more profitable dry land crop than these two members of the sorghum family. We have taken particular care in selecting acclimated seed stock of the true dwarf varieties, yielding two to three tons per acre. Write for samples and cultural directions.

WEST COAST CHICK FEED

They can't beat it. Nothing better for the little ones. 100 pounds, $3.25. If not sold by your dealer, we pay the freight within 100 miles.

PUMPING PLANTS

Completely Installed in Shortest Possible Time

We carry the most complete line of irrigation machinery in the State. We have the most competent corps of irrigating machinery engineers in the world. There is no plant too small to give our very best attention—none too large but what we are in a position to install upon the most economical and efficient lines.

The Name FAIRBANKS-MORSE Your Guarantee

Just a few words upon a post-card will bring one of our representatives to your door, no matter where you live. If you are interested in irrigation write for catalogue No. 67. If you are thinking of purchasing anything in the following lines, let us know and we will send you catalogue—they are free if you will only ask for them.

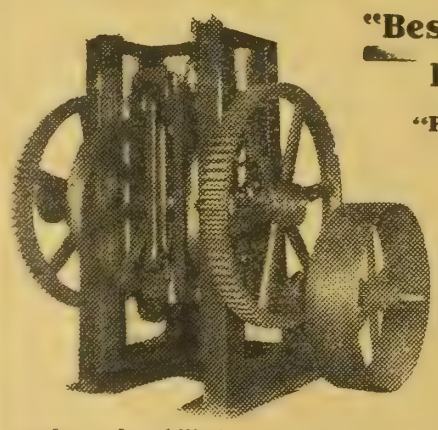
"The LUITWIELER Non Pulsating System"

"Best for Deep Well and Irrigation Work"



"PUMP TALK CONTINUED:"

"Luitwieler pumps are a finished product and come to you ready for immediate service. No babbitting or other machine work has to be done in the field. No pit is required."

"Luitwieler pumps are equipped with adjustable sliding bases for quick handling over the well. Pump may be removed in a few minutes. Also note that it does not require the services of a skilled mechanic to take apart and put together again when replacing leathers on the plungers."

"Luitwieler pumps apply the power uniformly and do not break rods. We guarantee absolutely against rod breakage. We also guarantee the least power consumption of any pressure pumping method. We further guarantee our cams and rollers against ever wearing out. No time limit."

"There is a reason for our success. Our pumps are most economical and most durable. Give us a trial to be convinced by your own experience. Established 1877.

Irrigation and Forestry

IRRIGATION AND DAIRY INDUSTRY IN "SUNNY STANISLAUS."

There are many irrigation projects in California, but none is more remarkable than the one which is now converting eighteen thousand acres of grain fields in Stanislaus County into five, ten and twenty-acre fields and fruit ranches.

The lands are those once embraced in the great Spanish grant—Rancho del Puerto. They are on the main line of the Southern Pacific Railroad. only ninety-seven miles from San Francisco. The soil is from twenty to thirty feet deep, without alkali or hardpan, and practically the same in all parts of the tract. The soil is a rich dark loam, with excellent under drainage, and the entire tract is smooth and even, sloping to the river with a fall of about twenty feet to the mile.

Even before irrigation was applied, the wonderful richness of the soil here made the property famous for its crops. Today, on the bank of the San Joaquin, a pumping plant, electrically operated and with a capacity of 50,000 gallons per minute at low speed, has been installed. The main canal, heavily lined with concrete, extends for three miles across the property to carry the waters which have their source in the perpetual snows of the Sierras. The entire irrigation plant has been constructed at a cost of $250,000, and in its capacity to furnish water and the security of its supply it is a model to the West.

The land is laid off in five units, and four pumping plants installed along the line of the main canal lift the water to higher levels. From each side of the main canal distributing laterals are taken off at points where the flow line of the canal is about eighteen inches above the ground. These laterals extend nearly eight miles, thus bringing a large acreage in each unit under irrigation by a minimum lift. The land is so even that there are no laterals t ofill, and therefore no danger of breaks and overflows such as occur where the laterals are built up over depressions in the ground. The soil type is of such quality and the slope of the land so uniform that it is practicable to deliver a very large head of water for irrigation without either washing or cutting the land. Indeed, experiments have demonstrated that it will be possible, under this system, to deliver heads of from ten to thirteen second-feet. When one remembers that a head of twelve second-feet will adequately flood a ten-acre tract in four hours and thirty minutes, the abundance of this supply will be appreciated. This provides for the delivery and distribution of water with the greatest economy of time and labor, and creates an ideal condition for the water user.

There will be forty-five miles of main laterals—twenty-seven miles already built—and of service laterals there will be seventy-seven miles, about thirty-five miles of which are now complete. These service laterals are built to reach the highest boundary point of each tract of land, where service gates are installed. The cost of these service gates and laterals is included in the price paid for the land, and the settler will not be bothered with such vexatious questions as the right of way across a neighbor's land, widening of ditches, or the expense of ditch or headgate building.

In the distribution of the water, a smooth-working and satisfactory system has been adopted and will be adhered to. The great pumps at the river will keep the main canal full, and the water will always be "on tap."

The great value in the security of a water supply for irrigation, that is, its dependability at all seasons of the year, lies not alone in the one or two extra cuttings of alfalfa which it makes possible, but in its maintenance of a stand of alfalfa unimpaired throughout many years. The value of water when needed to fill out the ripening fruit is also appreciated by the grower. These lands are peculiarly adapted to alfalfa, the soil being exceedingly rich, friable and deep. When alfalfa is not adequately supplied with water, or supplied only part of the year, it necessarily loses vigor, grows "spotted," and fails to make abundant yield. While the volume of the San Joaquin River decreases in the late summer months, at no time is the natural flow less than three times the amount of water required to adequately irrigate the entire property. The company is planting several hundred acres to alfalfa, fruit and vines for the special purpose of demonstrating the best and most practical methods of cultivation and irrigation, and the experienced men in charge of this demonstration will aid purchasers with advice on crops and the proper care of them. One share of stock is given with each acre of land. When all the land has been sold, the water system will belong perpetually to land owners and be controlled by them. The present acreage charge for water is very low.

The land has been subdivided into ten and twenty acre tracts. Practically nine years is given in which to pay for the land, and if the land is properly handled it will pay for itself.

Anything which will grow in a temperate or semi-tropic climate will do well here. The soil is especially adapted to walnuts, peaches and other fruits, and to alfalfa. Stanislaus County is California's record dairying county, and the dairy cow will here bring in a golden income. With the dairy go those big money-makers, hogs and poultry, both of which thrive on alfalfa.

The climate, while warm for a short while in the summer, is not oppressive, because it is cooled by the sea breezes from San Francisco Bay, yet it is warm enough to make a continuous growing season. The greatest markets of the West—San Francisco and the Bay cities, with a population of nearly a million—also Stockton, Sacramento and other nearby cities, are quickly reached by both rail and water transportation.

The town of Patterson presents the most modern ideas in townsite platting. It is a rapidly growing community, with a $25,000 concrete hotel, also good shops and stores, and has under way a $25,000 schoolhouse and a $20,000 bank building. A beautiful boulevard, lined with palms and eucalyptus trees, stretches from the town through the farms to the river, a distance of three miles, and another eight-mile boulevard, lined with syca-

which has been manufacturing one line of goods for over thirty years must be in a better position to furnish superior goods than one which has been in business a few months or years? The old concern has experienced engineers, superior shop facilities and, above all, a reputation and standing to maintain.

Krogh Pumps Have Been Built for 33 Years

Our New Bulletin, C-12, tells about them.

Krogh Manufacturing Company

Our Branch House, 206 N. Los Angeles St., Los Angeles, carries a complete stock

149-157 Beale St., SAN FRANCISCO

mores and oleanders, traverses the farms at right angles with the first one, so that the town may be reached by these tree-lined highways from any part of the tract. There are building restrictions on these boulevards, and no liquor is allowed to be sold either in the town or on the farms.

The amazing richness of the soil, with its corresponding wide range of productivity, the pleasant, healthful climate, the absolute surety of the water supply, excellent social conditions, nearness to markets, fine transportation facilities—all these are in every case up to the highest standard, and are bound to make for the success and happiness of every settler on these lands.

INTERESTING MEETING OF TULARE GRANGE.

By John Tuohy.

Remarks were exchanged between members on the effect of the frost on the 13th. It was generally agreed that potatoes, tomatoes and beans were hurt by it. No crop entirely destroyed. Potatoes are grown for commercial purposes, tomatoes and beans for home use. In grapes the first crop will be damaged. Those varieties, such as Sultanas, that have only one crop are damaged most. It is expected that with such varieties as bring two crops the second crop will be better. In citrus fruit no damage was done; in deciduous fruits very little damage was done by the frost. Prunes and apricots will be a short crop; Cling peaches and Muirs will be short; other varieties will bear good crops.

The question of the day was, "Should farmers take their own risks of fire, or insure in stock fire insurance companies?" The subject was fairly considered. Losses by farm fires are very few and far between. It is better the farmer should take his own risks against fire, but when a loss does occur to a farmer, as an individual, it is hard on him. Where an association of farmers provides against loss by fire, as in county insurance associations, each one helps pay the loss of the fire in proportion to the amount of risk he has in the association. In Sonoma County the County Insurance Society charges one mill on the dollar per year, and this has furnished a fund to pay all losses, and many have been paid in the thirteen years the association has been in existence, one of late for $3,500, the largest risk they take, and yet, after paying all losses and expenses, a balance is left on hand of over $5,000. State fraternal orders should have fire insurance for members; it would be an attraction to membership, and none but members who wanted fire insurance would have it. The order would make its own bylaws, and carefully watch their working. In the thirteen years the county farmers insurance has been in effect, and there is now perhaps $15,000,000 of risks written, every loss has been promptly paid; there has not been a suit for collection. Owners of business houses in Porterville have organized themselves into an association to pay a proportion of each one's losses by breaking of plate glass windows, the actual loss in breaking of plate glass windows being 25 cents a year, the stock insurance being $1.25 a year per window by the stock insurance companies. Mutual fire insurance is the safest and surest of all insurance, and should be provided for by the legislature, as now the state laws are simply prohibitive of such insurance.

PECAN PLANTING.

Not long since a prominent horticulturist asked me if I could tell how to transplant pecan trees so that the frequent loss of from 25 per cent to 40 per cent of the trees could be avoided. I have had losses as great as this; but since I learned how to set them, I have had good success. Of 248 trees transplanted a year ago last winter, none died. The pecan does not stand transplanting quite so well as peaches or plums, but there is no reason why there should be a loss of more than one to four per cent. Any loss beyond this signifies carelessness either on the part of the nurseryman who furnished the trees or of the man who transplanted them. Briefly stated, the rule for successful pecan transplanting is this: Never let the roots get dry from the time the tree is dug in the nursery until it is reset in its permanent location. The careful nurseryman heels in each tree as soon as dug; and when shipped the roots are well wrapped in damp moss. When received by the orchardist, it is best to set at once in holes that have been previously dug, only removing one tree at a time from the original package or other damp packing in which they have been carried to the field. Firm the soil well about the roots from the bottom to the top of the hole. If the soil is at all dry, pour in a bucket or two of water as the hole is being filled. If guano or manure is used, see that it is well mixed with the soil, and that the fertilizer does not come in contact with the roots. The size of the hole and the fertility of the soil have their bearing on the future growth rather than on the living of the tree. In only one case have I known trees to die from being set in too fertile soil. A friend set some trees in a very rich cow-pen and nearly all died; while others set at the same time in less fertile soil lived.—Coleman's Rural.

ALFALFA NOTES.

Irrigate freqently rather than by long continued soakings; over watering excludes air and compacts the soil.

Avoid pasturing alfalfa fields, especially when wet.

Cultivate alfalfa fields early in the spring, with the alfalfa renovator, disk, spring-tooth harrow, or any special alfalfa cultivator, for the following reasons.

(1) To break up compact soil conditions.

(2) To get air into the soil, which is very essential.

(3) To work leaves and other organic matter into the soil.

(4) To break up capillary action, thus conserving moisture.

(5) To destroy foxtail sod, grasshopper eggs, and other pests.

Cut alfalfa for hay when the growth checks and the plant puts out new shoots from the crown; this is usually about the time the plant is well started to bloom.

In curing alfalfa hay it should be done in the windrow and cock rather than in the swath, as the leaves will shatter if suddenly dried up in the sun. The undried green leaf is an important factor in reducing the sap in the stems in the curing process.—Philo K. Blinn, Alfalfa Specialist, Colorado Agricultural College.

The bacteria which are necessary to alfalfa in the soil for its proper growth are not found in the hay and so the droppings from cows fed on alfalfa hay will do no good as far as inoculating the soil with bacteria for alfalfa is concerned. The bacteria are on the alfalfa roots in the knots and nodules that are usually found on these when the plant is pulled up. The bacteria that are found in the nodules on sweet clover roots are much like those that the alfalfa plant utilizes and if you can get a load of ground anywhere in your neighborhood along the road where the sweet clover grows in abundance do so and scatter it over the plat which you wish to seed to alfalfa. This is generally considered very beneficial to a young growth of alfalfa which then grows nicely and soon develops a bacterial nodule growth on its roots.

---The Largest, and Lowest-Priced Furniture House in Western America

Our immense store—more than 150,000 square feet of floor space (to be increased June 1st by an addition of another great eight-story building, half as big as our present building), together with our mammoth warehouses—in all more than 500,000 square feet of floor space—contain the largest stock of furniture, carpets, Oriental and domestic rugs, draperies, wall papers, upholsteries, mattresses and bedding, linens, stoves and household wares, china, glassware, etc., etc., in the United States.

We pack goods carefully and ship promptly to any point.

A SOIL CONDITION.

Soil conditions are the prime requisites to successful agriculture, and the proper conditions are not all the same for all kinds of crops. A soil particularly adapted to one kind of crop may be wholly inadequate for others. The soil in proper condition for whatever crop to be grown must contain the absolutely necessary ingredient, moisture.

The moisture of the soil which is available for plant growth is known as free moisture, or that which is apparent. This moisture or water dissolves the salts of the soil and is taken into the plant roots to be used in the growth of the plant. This moisture is absorbed from the soil and by the capillary action follows along the minute tube that extends up the stem of the plant and out to the leaves, where the moisture is evaporated. This process is continuous and at the same time the growth of the plant is increased. We see that there must be some ratio between the amount of moisture absorbed by the plant and the increased growth produced.

Many experiments have been made upon different kinds of farm crops and the amount of water required to produce a pound of dry matter varies between wide limits. These tests indicate that 200 pounds of water will be necessary to produce a pound of dry matter, while in other cases as high as 800 or 900 pounds will be necessary.

This great variation is due to the climatic conditions, locality, kind of crop, and kind of soil. In the humid regions less water is required than in the arid country, and this fact partly explains why a greater amount of water must be held in the soil of our irrigated districts of the West. Wheat, in all probability, will require less water, per pound of dry matter, than oats, and alfalfa will require more than oats.

If we assume that an average crop requires 400 pounds of water to produce one pound of dry matter, and in the case of alfalfa, which produced four tons per acre for the season, will require for the above average about 51,200 cubic feet of water, or a depth of a little over fourteen inches over the entire acre, or 1.175 acre feet. This amount of water must be held in the soil particles as free water available for the plant growth. A good soil must be of such a nature as to act as a reservoir and at the same time supply the necessary chemical constituents to the plant.—R. L. Parshall, Colorado Agricultural College.

ALKALI FROM NITRATE OF SODA.

(Continued from Page 517.)

the presence of the alkali salts, have acid reactions and in the soils which do have acid reactions there can be no harm in the use of nitrate of soda until this original soil acidity has been neutralized and in all probability this acidity is continually forming from the decomposition of minerals in the soil forming acid silicates. It is to be remembered that 24 pounds of superphosphate will neutralize all the alkali formed from ten pounds of nitrate of soda.

Then I believe that under the present prices for nitrogenous fertilizers we should use liberal amounts of nitrate of soda on all open soils and on all acid soils. And I find that all our heavy soils which I have examined are acid with the one exception, that of the nursery cited above, and even that subsoil was acid. In the meantime we should encourage the manufacture of nitrate of lime as Dr. King suggested and it is highly probable that we will be able to get other forms of nitrogen to use before we have done any damage to our soils. Then if the present difference in prices persists we can even tile drain and wash out by that means.

C. C. Teague, Santa Paula.

We have never used any nitrate of soda on our property, and I, therefore, do not feel qualified to give you a statement in regard to it. Anything that I might say would only be from a conviction which would not be based on actual experience, and I do not care to give out a statement which might influence the growers in regard to the use of nitrate of soda, without actually knowing more about it.

I might say, in theory, the claims of Dr. King seem to be warranted; in practice, the question is, do the deleterious effects show up? Mr. Blanchard, of this place, has used considerable nitrate of soda, I believe, on his old seedling grove, and, I think, claims that he has never seen any injurious effects.

MAGNESIUM AND LIME AGAIN.

The following was received from Prof. J. H. Norton, of the Riverside Citrus Experiment Station, some time since. We desired to get a line on the information it contained, so deferred its publication until we could get down the old chemistry and brush up a bit on the symbols. However, we pass it on without waiting longer. But, seriously, it's full of information. Study it.

"You will find the following in the 'Chemical Abstracts Published by the American Chemical Society' under date of March 20. 1911:

" 'Experiments with lime and magnesium. D. Meyer, Agr. Chem. Vers.-Sta., Halle aS. Landw. Jahrb., 39, Erg. III, 254-98; Chem. Zentr., 1910, II, 406. 'In experiments with buckwheat and oats the dependence of the maximum yield on a definite proportion between calcium oxide and magnesium oxide could not be proved, either in the case of the soils with more calcium oxide than magnesium oxide or vice versa. The proportion of magnesium oxide, 1:3, considered unfavorable by Loew, gave a higher yield of buckwheat than 3:1 (considered favorable). The proportion 1:1 gave the same yield as the unfertilized vessels. With oats the ratio 1:3 increased the yield of grain. Magnesium sulphate and magnesium chloride, as well as sodium chloride, had a favorable action on cereals, but not on alfalfa, clover, mustard, beets, or potatoes. Addition of 2 per cent magnesium chloride and sodium chloride to soils worked more injury than magnesium sulphate, the injury being greater the lower the lime content. As to the lime requirements of a soil, the reaction as well as the lime content is of significance. Neutral soils with relatively small lime content show little lime reaction. In acid soils with high lime content the lime reaction is negative. Acid soils are unsuitable for the normal course of chem-biological processes and for the action of physiologically acid fertilizers, so that even with considerable lime content fertilizing with lime is a necessity. On an acid lime-poor soil, calcium carbonate and magnesium carbonate work favorably for clover, mustard and potatoes, while calcium sulphate works unfavorably.' "

An animal, warm from work, should not be allowed to drink large quantities of water.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Angora Rabbits.

Where can I purchase a pair of pure-bred Angora rabbits?—Subscriber, San Martin.

In the liner columns of this week's Cultivator appears the announcement of D. Caldwell Co., Los Angeles, that they have Angora rabbits for sale.

Bones for Poultry.

What treatment is necessary for bones that have been bleaching for several years to make them suitable for poultry food? We have "oodles" of them in this section.—Subscriber, Wilcox.

The only treatment which would be necessary would be to have a crusher which would reduce them to a meal or particles small enough for the poultry to swallow. They would not have the value of green cut bone; at the same time, in the absence of the latter, they would make an excellent addition to the diet. We think that the ordinary bone crusher, not the cutter meant for green bone, would be satisfactory. It should be run with a gasoline engine; don't put the job on the small boy.

Cypress in Arizona.

What is the lowest temperature Monterey cypress will stand? I want to plant windbreak, but our temperature has been known to reach as low as zero for a few minutes. Our altitude is 4,200 feet. Is there a better tree?—H. A. S., Wilcox.

The Monterey cypress has done well in sections in Oregon known to have occasional zero weather, and probably would do fairly well in Arizona. There is one of Arizona's native trees which might prove its superior; it is known as Arizona cypress, at least seed is kept for it under that name in Los Angeles seed stores. It is a native of the Williams Mountains and perfectly hardy anywhere within the boundaries of the state.

Locust for Fence Posts.

Can anyone inform me as to locust timber for fence posts? Will it stand in the ground for any length of time? —Subscriber, Healdsburg.

Locust timber has a good reputation for fence posts, and if seasoned and dipped in creosote is an excellent keeper. Under proper conditions, red gum or eucalyptus rostrata would be preferred, and they will grow in the Healdsburg section. The catalpa is a more rapid growing tree than the locust, and is fairly satisfactory. We would be glad to learn of experience of any of our subscribers as to keeping qualities of locust, especially as to whether there is any difference in timber cut when dormant or in full flow of sap.

Fertilizer on Alfalfa.

What kind of fertilizer will be good to put on alfalfa? It is planted on very sandy soil and does not look thrifty. Of course, I do not want to injure these young plants.—Subscriber, Hynes.

On sandy ground there is no fertilizer which is the equal of stable manure. It has the advantage of carrying into the soil a quantity of humus, which is what sandy ground needs, for it adds to its water-holding capacity, and one cause of sickly-looking plants on sandy soil is lack of moisture. Best results are secured by heavy application, working well into the soil before seeding, but we believe it would prove satisfactory in this case. If soil has sufficient humus, the application of a complete commercial fertilizer composed only of phosphoric acid and potash might be sufficient, for if the soil is supplied with nitrogen-gathering bacteria, the alfalfa should be able to secure its own nitrogen. A possible explanation of the sickly-looking alfalfa may be that the soil is not so supplied. Test of this could be made by securing a quantity of soil from a field which is thriftily growing. Scattering and working in this soil on a small plot of ground would determine whether that is your need.

Laying Out Orchard.

Please give plan and instructions for laying out ten acres, twenty by eighty rods, which will give the greatest number of trees per acre. Trees to be twenty-five feet apart each way and in rows every direction. How many trees per acre can be planted on the same land, using the diagonal plan, trees twenty-five feet apart each way?—Subscriber, Garden Grove.

We cannot understand how we can give any further instructions to the subscriber as to laying out his ten acres. As we understand it, he wishes the trees to be set square and twenty-five feet apart. This is inflexible, and no planning can change the matter. As to method of work, the laying out is usually done by use of a wire on which are tags soldered, or securely fastened, every twenty or twenty-five feet, or whatever the distance is. The wire is drawn perfectly taut, and care taken to always work from one end of the wire, to express it in military fashion, "guide right" all the time. If this is carefully done, the trees will be perfectly lined in every direction. It will be somewhat simpler if a long enough wire is to be had to "lay out" the eighty-rod way, but with greater care a shorter wire may be used the short way. In working that way a wire 330 feet long with twelve tags will be sufficient. This will allow for twelve trees to the row, leaving fifteen feet from each border line. Of course, on a street side this would be more than necessary, but if sides adjoin other property where trees are planted close to the line, fifteen feet will be none too much. The more common distance is eight or twelve feet, however, and by making a slight reduction of the twenty-five feet an additional row of trees might be secured. If greatest care is used in stretching the wire and keeping the first row absolutely straight the long way, then the cross work will show the short rows equally as true. Pegs placed by the tags on the wires will be exactly where the tree is to be. The use of the notched planting board and other aids to planting require too extended description to be given in these columns.

The number of trees per acre where set twenty-five feet square is sixty-nine; the same distance apart by the equilateral or triangular method, seventy-nine. In theory, the triangular method gives just as much space to the tree, but from our experience we would prefer the square system, for the gain in additional number of trees is offset by additional work, and it results in crowding much quicker.

Novel Leveler.

We have received a letter from Fresno, from one who signs himself "Ma-

CALIFORNIA ANCHOR FENCE CO.
MANUFACTURERS OF
FIELD, POULTRY, AND ORNAMENTAL FENCES
IRON AND WOOD GATES, ETC.

Stockton, California, April 27, 1911.

To Fence Users:

Did you ever figure the cost per year of one rod of fencing? Have you compared the cost and number of years of satisfactory service of our KOKOMO and PIONEER fences with other makes? The biggest users and most shrewd buyers are using our fencing. Why?

Before you buy, write us just what you require in either farm or poultry fence, gates, etc., and get our net prices and illustrated catalogue showing our different styles of guaranteed fences. It's free.

Respectfully yours,
CALIFORNIA ANCHOR FENCE CO.

When writing advertisers, mention Cultivator.

chinist Farmer," with description and sketch of a novel device for determining slope of land or for leveling lands. We do not reproduce the sketch, for the reason that it does not appeal to us as being as practical as some of the simpler leveling devices. It has the advantage of economical construction, but the disadvantage, it seems to us, of being cumbersome. In lieu of engraving, we describe: Two pieces of glass tubing, twelve or fourteen inches long, similar to those used in the steam gauge of boilers, are firmly attached with copper wire to uprights, the center or graduated line on each being identical as to distance from base or foot of the uprights. At the lower ends of these glass tubes is securely attached a rubber hose and filled with water. Farmer Machinist sends us the following description of the device:

"My scheme is for checking up land, lining shafting, gas engine foundations and other uses. It is made as follows: Get two ½-inch water glasses, one piece of light rubber hose (25 or 50 feet), two pieces of wood ¾x1¼ inches, have them made with foot ¾x3 inches square, also two corks to fit glass, and fasten with string on wooden upright to plug glass when needed. Fill with water to lines. Now, when leveling up check, drive stake on high ground, hold one upright on top of stake and carry the other, say, twenty-five feet. Drive stake until water in glass shows equal on both glasses, that is, to center line. Care should be taken to fill glasses until water comes to center line of both glasses. After the first twenty-five feet is laid off, keep doing so around the piece of land. For lining up shafting, hold the center line to bottom of shafting, or stand on top if you have head room enough; same with engine foundations or anything you want to line up, and it will be accurate."

Flea Beetle.

Will you kindly advise through your department as to best time to spray grapes for the flea beetle. We have your valuable issue of Nov. 3, 1910, worth several years' subscription, which tells what to use.—N. B., Elk Grove.

The so-called flea beetle of the grape in this state is not the regular flea beetle as it does not hop around but is the adult form of the imported root worm. The insect injures both the roots and the top of the vines. It is about one-fifth of an inch long, blackish brown in color. A hopper cage will take them when they are in the winged form. They are also well controlled by an arsenical spray. A strong dose is required. Lead arsenate five pounds to fifty of water or Paris green one pound to a hundred gallons of water, to be applied when the beetles first make their appearance. In the younger form before becoming winged if the vines are dug thoroughly around to the depth of six or eight inches many of them can be destroyed. If they were in my vineyard I should dig into the ground in February and in March and April most thoroughly to destroy them. This digging would increase the crop enough to pay for itself, like the old story of the man who told his sons on his death bed that if they dug they would find a pot of gold in the vineyard.—M. E. S.

Wooden Silo.

"Back East" I used silo built of 2x4 like a barrel with iron hoops. Can a silo be successfully used in this climate if built of the same material? I fear the dry summers and changes in temperature from night to day would do away with it.—A. K., Kerman.

Yes, silos are a success in California. We have on this ranch a wooden silo still perfect that has been in use nineteen years. I do not suppose there can be a greater need for silos anywhere than right here in Fresno county. Butterfat is cheap when the spring flush of feed is on and dear when the grass has lost its freshness. —M. E. S.

Bamboos for Turning Stock.

I have been told there are certain varieties of bamboo that will turn stock and at the same time be good soil binders along the banks of streams where there is danger of washing. I have found that the arundo donax is a perfect soil binder, but of no value in turning stock. What may be planted with that?—Subscriber, San Luis Obispo.

Acacia horrida, acacia eburnea and lycium horridum are all heavily supplied with thorns and will turn any stock. If there is no fear of the plant becoming a pest, the Eastern hedge plant used so extensively a few years ago, osage orange, will be found to make a perfect barrier.

White Minorcas.

What are the Standard requirements for White Minorcas?—Subscriber, Riverside.

The Minorca is the largest of the Mediterranean breeds. Body long, comb very large, wattles large, earlobes white, dark-colored legs and pinkish-white or flesh-colored skin. Head should be carried high, tail spread and carried at an angle of 40 degrees from the horizontal. At shoulders back should have appearance of being rather flat, lines of breast and body well rounded, and general carriage graceful. Standard weight is for cock 8 pounds, cockerel 6½, hen 6½, pullet 56. Plumage should be compact and free from any foreign color. Head moderately long, wide and deep, with beak of good length, stout and well curved. Comb should be moderately large, straight and upright in the male, and forming a loop over the back in the female. Neck should be long, arched, hackle abundant and flowing well over shoulders, wings large and well folded.

Cow Falling Off.

My cow has been falling off since calving two months ago, has little appetite. Three weeks ago when I went to milk her she could hardly get up, seemed to be stiff all over. In a few days she improved, but now is quite stiff again. What can I do for her?—Subscriber, Saugus.

The first attack looked as though it might be a very mild form of milk fever. As it was recurrent I should now suspect that she did not clean properly after calving. Have her examined if possible for this and the doctor will prescribe for her. If not convenient to see a doctor, examine for any discharges, and if there are any, use a douche with corrosive sublimate tablets once a day. Then the local druggist will supply you and tell the amount of warm water to use with each. Give her internally a teaspoonful of bisulphite of soda every day in a mixed feed. A little oil cake meal would help. A mixture of one part rolled barley, one part bran and one part oil meal, giving her a quart a day, will help her tone. Begin by giving her half the quantity. If not convenient to buy oil cake meal get a package of one of the standard mixed stock foods until she comes to her appetite again.—M. E. S.

Withertip.

I am sending lemon twigs which show a dying condition and yellowing of leaves. The affection is on the south side of the tree, twenty years old, and the only one in 500 which is showing the disease. Also send fruit from diseased branches. Does not grow to proper size and falls off.—Subscriber, Ioamosa.

These twigs were affected with withertip. The fruit also shows the characteristic marking or pitting of the skin. The small size and elongation of neck are doubtless due to poor condition of the tree. The proper treatment is spraying with Bordeaux mixture. The disease may be brought under entire control by using it.

Tariff on Lemons.

Is there a tariff on oranges and lemons, and how much? What would be the effect upon the citrus industry if there were a great reduction in the tariff?—C. S. B., Rialto.

The tariff on lemons is 1½ cents; on oranges, 1 cent per pound. Discussion of the effect of removal or reduction of this tariff would be to a certain extent political, and in any case we are compelled to acknowledge we cannot answer. The presumption is that it would result in great injury to the industry, for the one reason, amongst many, that the cost of production and of transportation from the Mediterranean sections to the Atlantic seaboard is much lower than cost of similar charges to California growers, but to enter into this fully would require pages and lay the paper open to the charge of being prejudiced.

Dieback.

I send you herewith two lemon twigs with strange infection.—Subscriber, Escondido.

These lemon twigs were affected by dieback, which may be caused by a number of different things, such as tree being over hardpan, the ground having lost its humus and become compact, excess of nitrogen, or any cause that will lower the vitality of the tree. The only way to determine it is to make a thorough examination and put the tree in the best condition, when the trouble will be dispelled. Dieback is sometimes confused with withertip, a far different proposition, and which may be handled by spraying with Bordeaux mixture. No spray will reach dieback.

TRICKS OF THE TRADE.

Bobby—"Are you the trained nurse mamma said was coming?"

The Nurse—"Yes, dear. I'm the trained nurse."

Bobby—"Let's see some of your tricks, then."—Early Bird.

ARE YOU ONE OF THEM?

There are multitudes of young people who are not in the public schools, but who look to the business college for the special educational training and finishing needed preparatory to lucrative business employment. Of such the major portion of a thousand enroll every year at the ISAACS-WOODBURY—the recognized leader since 1884.

We have abundant teaching force of the highest grade, clean and inviting rooms, with perfect light and ventilation—100 FEET ABOVE STREET NOISE AND DUST. Call, write, phone. New Catalogue—27th year.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Elephant Leg or Glanders.

A high-class driving horse, apparently well on Sunday, has a chill. Monday morning the left hind limb is badly swollen and sensitive. Urinary organs and bowels act normally. Appetite good. After three days the limb remains swollen and the horse has a cough and also a discharge from the nose. The discharge has "rather a greenish color." — Subscriber, Norwalk.

If the symptoms ended with the chill and the swelling of the leg, we might be justified in prescribing for a simple case of lymphangitis or elephant leg—but the discharging from the nose of a greenish matter leads us to suspect glanders. Separate this horse from other animals. Use carbolic acid, 5 per cent solution, freely on the hands after handling horse. Have a qualified veterinarian examine the horses, and if he pronounces the disease glanders, destroy the horse and bury or burn the carcass.—F. G. M.

Caked Udder.

Please inform me what I can do for a heifer which has a badly caked bag. The condition evidently existed before she dropped her calf, five or six days ago. The bag is hard yet.—Subscriber, Covina.

Mix equal parts of zinc-oxide ointment and belladonna ointment and apply to the inflamed part with gentle but prolonged hand rubbing. Make a hot dry pack by filling a small bag about one-third with bran and heating in the oven of a cook stove, then, after using the ointment, adjust this to the udder, covered with a blanket to conserve the heat, and suspend in place by bands crossed over the back. Renew the application two or three times daily.—F. G. M.

Scours.

A young horse scours when idle, but as soon as he is worked is some better. His teeth are in good condition. Have given condition powders and tried rolled barley. He is fed the best of barley hay and given pure water, but remains thin and spiritless.—Subscriber, Garden Grove.

Give the horse one pound of epsom salts in a quart of water as a drench, and three days later follow with two ounces of turpentine in a quart of sweet oil. Drench slowly through the mouth only, taking care not to strangle the animal. When the last dose has ceased to operate, give three times daily, in the food, dried sulphate of iron, nux vomica and gentian, one drachm each.—F. G. M.

Debility in a Cow.

A Jersey cow, six years old, delivered her second calf, dead, last September, and since that time has gradually lost flesh, though her appetite has remained good. Recently she was noticed to fall occasionally, but regained her feet quickly. Now when she falls she cannot get up without assistance, but with a little lift she gets up, and when someone supports her hind quarters she walks with apparent ease. There is no evidence of pain, and the milk yield has continued regular. The extreme weakness is the only indication that she is diseased.—Subscriber, Surrey.

Evidently a portion of the afterbirth was retained at the time of calving, and its absorption has surcharged the blood with impurities, resulting in a weakened condition, which has permitted some internal disease, possibly of the nature of a tumor growth, to gain ascendancy over the body. The animal is undoubtedly in a serious condition. Begin treatment by giving one pound of epsom salts and a half teacup of table salt dissolved in a quart of water to which is added a tablespoonful of powdered red or chili pepper. Drench slowly, giving a little at a time, allowing the cow to swallow between draughts. Have your druggist mix the fluid extracts of nux vomica, cascara sagrada and gentian, of each two ounces, in ten ounces of wine, and give one ounce of this mixture on the tongue three times daily. —F. G. M.

Warts.

Cows, pastured with calves having warts on their heads, have contracted the disease, and now these spots, which are very disfiguring, are appearing around the eyes and on the heads of the cows. Kindly give us a simple remedy.—Subscriber, Valley Center.

Ordinary warts are not contagious, hence this disease must be of parasitic origin. Saturate the spots, where permissible, with tincture of iodine three days in succession, and then apply castor oil daily till cured.

OWN YOURSELF.

"We can't lose ourselves in crowds. We exist, each by himself, in our own personalities. If I were asked to name the three things most important to young men now, I should say, self-possession, simplicity, and a right standard of values. There is no social problem more grave than the tendency toward cities. In the founding of the republic we got character out of conditions not ordinarily characteristic of the life of great cities. We got deliberation and reflection in the long winter evenings with opportunities for reading and study and thought. Men were close to the land. The tendency of modern life in cities is too great pace.

"If a young man is not on the run most business houses have no use for him. In the vulgar, but most expres sive phrase, he must 'get a move on.' If he can't get a move on he must get out. There is danger that, under a commercial life like ours, a young man under orders will lose possession of himself finally. The drive threatens to take possession of us.

"In days like this a man wants first of all to get possession of himself, to have some hours in the business day to think over his blunders and his sins. It is necessary that you have time to say to yourself that you shall be God's man, owning yourself, when the day is done, as you did when it began."—Bishop Potter.

A SOAP TO KEEP THE HANDS SOFT.

There are always small pieces of soap left in every household. Collect them, add half their weight in oatmeal; now put your soap into a saucepan with a little water, to dissolve. Keep stirring till all is melted, then add the oatmeal, and when it is well mixed turn it out onto a piece of wood to cool. Divide it into small cakes with a sharp knife, and leave it three or four days to thoroughly set before using.

A little bit of kindness
To others now and then;
A little bit of blindness
To faults of other men;
The wish to be forgiving
When things somehow go wrong,
And life is worth the living
And hope is in the song.

"Let There be Light."

—PAT HENRY, before the battle of Bull Run.

We are not sure that our old friend Pat has been correctly quoted, neither do we know that he was anywhere near Bull Run during that memorial event, but we do know that every Rancher, Miner, Dairyman, Stableman and Teamster on the Pacific Coast should be in possession of at least one of our Vehicle Headlights, here illustrated.

There are times when a good, strong light is almost indispensable. It is needed around the barn, the thrasher, the harvester, on the gang-plow, on your wagon or buggy when driving over rough roads, the ranch, the mine or the dairy.

A Boesch Vehicle Headlight is worth a dozen ordinary hand lanterns. They are well made, strong and durable, each one is fitted with a highly polished silver plated parabolic reflector which concentrates the rays of light with remarkable brilliancy. The body is finished in a rich glossy black with polished brass trimmings, and for appearance it is first in order of handsome lamps. It embodies all our latest improvements, and for efficiency as a light producer it is without equal. This is the Headlight that caused the passing of the State Law prohibiting the hunting of wild ducks by artificial light. It is being used by nearly every Fire Department on the Coast and in many of the large Eastern cities.

Do not be led into buying a cheap, inferior lamp. It won't pay. This one is the result of forty-two years' experience in the business. It is home industry, and we guarantee satisfaction. It is made in 6, 8 and 12-inch sizes, measurements across the face.

We also manufacture many other styles of Headlights, Lamps, Lanterns, etc., too numerous to mention.

Write for Catalogue and full particulars of lamps or lanterns that you require.

Timely Ranch Suggestions

FERRETS.

The great number of queries received by the Cultivator regarding ferrets induced the gathering of information as to these little animals. Ferrets are of the weasel family, nearly allied to the polecat; some even claim that they are a domesticated variety. They are much smaller in size, height and body, about fourteen inches around, tail five and a half inches. The muzzle is long and pointed, the color usually yellow with more or less white. Ferrets were imported into Europe from Africa, and were used by the Romans for catching rabbits, sometimes being muzzled and sent into the holes to drive them out, again attached to a piece of string and drawn out when they had seized their prey. They are capable of only partial domestication, and tolerate handling, though they never manifest any attachment. They usually breed twice a year, the brood consisting of from six to nine.

The largest breeding center is New London, Ohio, and from that point they are shipped all over the world. They are used extensively in ridding old buildings of rats, also for hunting any of the smaller animals which burrow.

We are indebted to Mr. Trell W. Messenger, of New London, for the following facts:

"Yes, many ferrets are raised here, in fact more than in any other locality in the United States. They ship a great many to the Atlantic coast and turn them loose in the large freighters for rats, and some go to the Pacific coast. At present all are sold out excepting breeding stock, which is valued highly. Money would not buy them this time of year.

"Shipping generally commences about August at $1 or $1.25 a head, and by November or a little later they bring $5 and $6 a pair, so you can see how rapidly they advance.

"It is nature for ferrets to hunt, and all the training they need is to teach them not to be afraid of you when they come out of a hole. Anyone can handle them with good gloves, but the breeders very seldom use them. I think the reason there are no breeders of ferrets in California is that the fleas are a great pest and would doubtless prove a serious handicap."

It having been suggested that ferrets may prove a pest if introduced into this state, we wished a ruling from State Commissioner Jeffrey, and he writes:

"There is no specific reference to this animal in any of the statutory laws relating to agricultural interests, as far as I am aware. Nor has the ferret ever been declared subject to quarantine in any order on file, and inquiry indicates that no attempt has been made to exclude this creature from the state. However, the State Quarantine Act of 1899 provides that no person, persons or corporations shall bring or cause to be brought into the state any animal detrimental to horticultural and agricultural interests. While the ferret has never been formally declared detrimental, I believe it may justly be considered so and that it should be kept out.

"This semi-domesticated little animal is a bloodthirsty beast. It is very prolific and would no doubt flourish and increase in the mild climate of California. Its presence would not increase the tribes of beneficial birds. Nor would it conserve any useful purpose that I can think of, unless the sport of ferreting out ground squirrels might be termed useful. I think the importation of ferrets should be discouraged, and if necessary it may be prohibited by the State Commissioner under the authority of the law referred to."

We doubt not Commissioner Jeffrey's statement that "Its presence would not increase the tribes of beneficial birds" is strictly true, unless it reduced their natural enemies. If given liberty, however, and if the tribe increased to any extent, it would prove a menace to poultry. We can find no record of its ever having become such a pest. Bailey's Cyclopedia says "It is one of the most effective exterminators of prairie-dog towns."

BREEDING COTTON.

The most disturbing factor in the whole cotton-growing industry continues to be the steady advance of the Mexican boll weevil. The necessity for breeding of earlier types of long-staple upland cottons has reached an acute stage, because the region where most of this cotton is grown has been invaded, and is now infested sufficiently to make a scarcity of this type of cotton. So far the damage resulting from the weevil has been greater in humid regions than in the drier parts of Texas.

This crisis is being met in two ways: First, by the use of Columbia cotton, a variety originated by Dr. H. J. Webber, by selection from Russell's Big Boll. Columbia has attained great prominence in the long-staple region in Mississippi, since it is earlier than the varieties now grown. Second, by the introduction of a variety with long-staple which is still earlier. This variety, which has been named the Foster cotton, is yet in its infancy but it is in great demand. It is a cross between Sunflower cotton, an old-time long-staple variety, and Triumph, an early big-bolled, short-staple variety.

The department of agriculture is this year making a distribution of a new variety of cotton for Texas conditions, which has been called Trook. It is early, large-bolled, very productive, and with a very high percentage of lint. It is a cross of Triumph on Cook's Improved, the latter variety being an eastern big-boll cotton with a high line percentage.

Mr. O. F. Cook has a strain of Mexican cotton from the state of Durango which showed very favorable results in a number of plantings in South Texas in 1909. This cotton has lint about 1¼ inches long, and is early and productive.

The wilt-resistant varieties distributed by Mr. W. A. Orton for the eastern cotton region are giving excellent satisfaction to those regions, where this disease is a serious factor in cotton production.

Since cotton is an open-fertilized plant the question of the amount of crossing becomes very important for the breeder. It is a subject which has been too much neglected in the past. The amount probably varies with localities, and with seasons, and may be different with different months of

the same year, depending on the variations in the insect fauna. For this reason experiments should be planned in many places, and for more than one year.

Two papers are presented this year bearing on this subject, one on conditions in northern Georgia in 1908, and one for central Texas of the same year.

These results are not entirely comparable, but both indicate a considerable amount of crossing. It is planned to have other experiments ready for report at our next meeting.—American Breeders Magazine.

AN ALFALFA BANQUET.

During the past year or so the value of cottonseed meal as human food has been studied by investigators with favorable results, and a few months since a banquet was served in Washington, D. C., at which many of the dishes contained liberal quantities of cottonseed meal. The attention which this banquet attracted in the newspapers aroused the ire and awakened the jealousy of western alfalfa enthusiasts, and it is now announced that they will hold an alfalfa banquet in Colorado, which will make the cottonseen meal banquet look like a handout at the kitchen door.

"The very idea of cottonseed meal having anything on alfalfa as food," hotly declared one of the alfalfa enthusiasts. "I understand at that cottonseed meal banquet they served biscuits to the guests, and when they had partaken of those they served more biscuits; but I want to tell you that at this feast there will be something more than biscuits."

When pressed to name some of the alfalfa dainties which will be on the menu, he said that, though he had planned a big surprise, he felt that he owed it to the public, and his expected guests in particular, to tell just what kind of "alfalfa eats" were coming to them. He said:

"To start with, there will be alfalfa biscuits, made from alfalfa meal; then there will be turkey stuffed with alfalfa; alfalfa will be served in the place of potatoes, and there will be alfalfa leaves in the place of spinach. There will also be alfalfa salad, and for beverages alfalfa tea and alfalfa cider. When the meal is finished the guests will be given alfalfa toothpicks made from alfalfa straw."

"Is that all?" was asked of the alfalfa mill man.

"Oh, no—I almost forgot. Former Governor Alva Adams will be the chief speaker, and the subject of his discourse will be 'Alfalfa and Apples.' Isn't that enough to make those cottonseed meal men from Dixie turn green with envy?"

We do not want to dampen the enthusiasm of our southern and western friends. A healthy pride in what one has, and the determination to make the most of it and be content is to be encouraged rather than discouraged. But we remind them that each man has but one stomach, and that he owes it a decent sense of respect. Stomachs which do not receive this respect and consideration have a way of wreaking vengeance which is both effective and discomforting. We suggest, therefore, to our friends of the South and West that they sell their cottonseed meal and alfalfa hay, both of which are bringing good prices, and with a portion of the proceeds buy some of our good corn, wheat and oats, which, when properly prepared, not only tickle the palate, give that comfortable sense of fullness and impart strength to the body, but are welcomed by the stomach as proper foods for its use.—Wallace's Farmer.

WHO OWNS THE POSTOFFICE?

Under the auspices of the Postal Progress league a postal conference was held in Washington on April 25, in aid of the establishment of a parcels post.

Merchandise is sent from Europe, carried by our postoffice department across the United States and delivered in Los Angeles at a cost of 8 cents a pound, in single parcels weighing up to 11 pounds. The government does that for foreigners. It treats its own citizens in a niggardly way. It will not accept for domestic delivery a parcel weighing over four pounds and charges 16 cents a pound for the service, even though the parcels be transmitted but from Los Angeles to Pasadena.

The express companies have been the beneficiaries of the government's policy, and senators acting in the interest of the express companies have governed and controlled that policy. For a generation congress has been far more concerned in protecting the express companies in their monopoly than it has been in relieving the people from extortion. The companies have been a part of the system whereby legislation was controlled for the benefit of private interest and special privilege, whereby Big Business was endowed with the power of taxation to gratify its private greed and fatten its avarice.

Unhappily, the postoffice department is under the control of an official from whom the trusts may expect much, but from whom the people can expect nothing. But congress is his master, and congress steadily grows more progressive, more responsive to and more representative of the people. And, after all, who owns the postoffice department? The people. In whose interest should it be conducted? In the people's interest. Well?—Los Angeles Express.

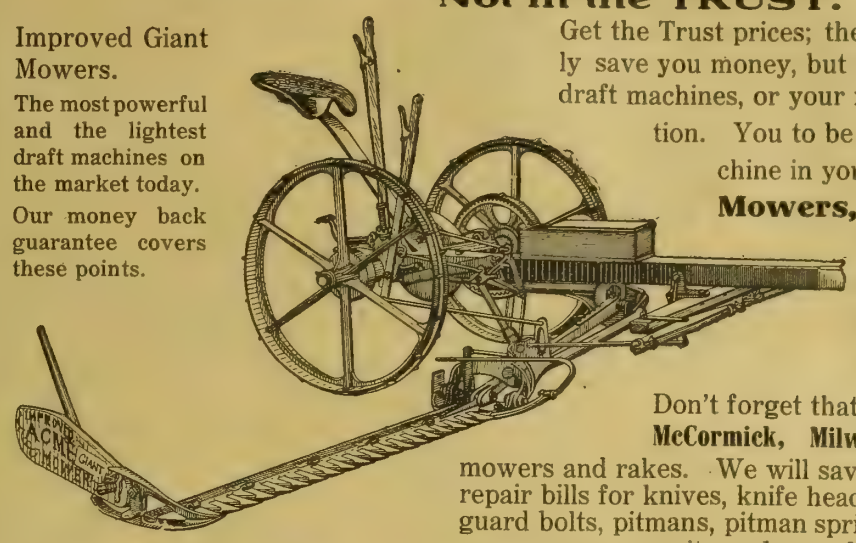
INDEPENDENT ACME

Not in the TRUST.

Improved Giant Mowers.

The most powerful and the lightest draft machines on the market today.

Our money back guarantee covers these points.



Get the Trust prices; then come to us and we will not only save you money, but guarantee you better and lighter draft machines, or your money refunded without a question. You to be the judge after you test the machine in your field.

Mowers, Rakes, Sweep rakes, Stackers and Binders.

Day-Old Chicks and Eggs Only—Barred Rock; good laying strain. The Fairmount Hatchery, 29B, Rural No. 1, Santa Cruz, Cal.

Mammoth Pekin Duck Eggs, $1.00 per dozen, $6 per 100, Select White Leghorn eggs, $3.50 per 100. Clough, 3826 Peralta Ave., Dimond, Fruitvale P. O., Cal.

Baby Chicks Every Week—Eggs for hatching. Large, vigorous, heavy laying strains. S. C. White Leghorns, Barred Rocks. D. S. Willey, Inglewood, Cal.

POULTRY

1889-1911—Barred Plymouth Rocks, Ocean Blue Strain. Birds of our breeding made a phenomenal record in the hands of our customers this season. Won first place at five of the largest Coast shows, besides many shape and color specials. Fourteen silver loving cups were won by this strain. We won in every class at the big Los Angeles Show—something no other exhibitor of Barred Plymouth Rocks can claim. Every female in pullet pen for this season is a winner either in pens or singles. Every male heading cockerel mated pens this season is a winner either singly or in pens. We are ready now for your egg orders. Same old price—$3 and $5. Mr. and Mrs. D. T. Wieland, Moneta, Cal. Take Redondo car via Moneta avenue. Get off at Illinois street, right on ranch.

White Orpington and White Wyandotte eggs for hatching. My winnings at Los Angeles 1911 were 1st cock, 1st hen, 1st and 2nd cockerel and 1st pullet on White Wyandottes. White Orpingtons, 1st, 3rd, 4th and 5th pullets, and 2nd and 4th hens. I breed my winners and am up to date in mating for results. I have no other business. Eggs sell at $3.00 and $5.00 per 15. No more stock until May 15th, when I will sell part of my breeders. Order direct from this ad and your order will receive my most careful attention. A. W. Huskins, 713 Waterloo St., Los Angeles, Cal.

Eggs from selected, trapnested stock. White Minorcas, beauties, layers of large white eggs, eggs $3.00 per 36. White Wyandottes, great winter layers. White Plymouth Rocks, Fishel's strain, prize winners, eggs from both $2.50 per 36, $6.00 per 100. White and Brown Leghorns, very select stock, $2.25 per 36, $4.50 per 100. Pearl Guineas, $2.00 per 15. Bronze Turkeys, 20c each; none better. I have about 500 per week of day-old White Rock chicks, Fishel's strain, for sale, $15 per 100, 17½c for less quantity. W. D. Rose, R. D. 6, Santa Ana, Cal.

Overcrowded; will sacrifice a few splendid White Rock roosters, 20 months old, fine breeders, $5.00 apiece while they last; also 6 hens, 20 months old, for $10.00. Write Dr. T. J. DeVaughn, 30 N. First St., Alhambra, Cal.

Rose Comb Black Minorca eggs and chicks from the largest and best mated flock in California. Eight-year line bred to pay and win. Free circular tells all about them. Eleanore Minorca Farm, Route 1, Los Angeles, Cal.

Cook & Kellerstrass Strain Orpingtons—"The Real Thing." The Standard Poultry Yards, 3944 Cleveland Ave., San Diego. Cook Black, Buff, and White Orpingtons. Eggs and baby chicks. Northrup S. C. Black Minorcas. Send for folder. C. A. Loud, Prop.

This is My Last Notice for the Season. Those who desire eggs from either "Kellerstrass" White Orpingtons or Buff Wyandottes should write at once and book orders. Orpington eggs 20c each, Wyandotte 10c straight. Good stock. Satisfaction guaranteed. Frank Haasis, Ontario, Cal.

Goose Eggs for hatching from the largest and best flock of Toulouse geese in California. 66 mature breeders, all 3 and 4 years old. No young birds in the lot, which contains a number of first prize winners. Eggs weigh one-half pound each. Price 35c or $3.00 for 10. Long Beach Poultry Ranch, cor. 10th and Walnut, Long Beach, Cal.

R. I. Reds—Much time may be saved in producing heavy layers by buying eggs from a breeder who has established a record by specializing in heavy laying stock. Eggs, hundred $5.00, finely pointed; 15, $3.00. "The Luedkes," Anaheim, Route 1.

White Leghorn and Black Minorca hens, one year old; fine layers. B. de Groot, Aptos, Cal.

Orland Hatchery—White Leghorn chix, $8.50 per 100. $80.00 per 1,000. Brown Leghorn chix, $8.50 per 100. P. L. Simpson, Orland, Cal.

Day-Old Chicks for Sale—Barred Rocks, 12½c; White Leghorns, 10c. Baby ducks, White Pekins, 16c. Orders for April and May delivery taken. All good stock. S. Stone, Moneta, Cal.

Barred Rocks exclusively. Eggs $1.50 and $3.00 for 15. Hatched chicks 15c and 20c each. Fine young stock later. Correspondence solicited. G. L. Hawley, Madera, Cal.

Single Comb Brown Leghorn Eggs—$5.00 per hundred, $1.50 single setting. Mrs E. Foran, Box 445, Visalia, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately Allaway & Layton Co., 607 E. 3d St., Los Angeles, Cal.

White Minorcas (Exclusively)—Eggs for hatching from first-class pure bred stock. I. V. Peterson, Guerneville, Cal

Very Fine Strain Barred Rock, S. C. Black Minorca, R. I. Red. Chicks $14.00 per 100; eggs, $1.00 per setting of 15. All pure thoroughbred, guaranteed. R. B. Sherman, Newcastle, Cal.

S. C. Brown Leghorn cockerels. Eggs $3.50 per 50 or $7 per 100; $2.50 and $5 per 15. Mrs. C. H. Vary, Pomona, Cal.

Barred Plymouth Rocks—The kind that "Win and Lay." Eggs and stock for sale. C. H. Vodden, Los Gatos, Cal.

Blue Andalusian and Buff Orpington eggs —from best strains. $2.00 per 15. Few choice Buff Minorca eggs. Mrs. A. V. Cox Box 302, San Luis Obispo, Cal.

S. C. Brown Leghorn Baby Chicks, May 8th, $7.50 per 50 or $15 per 100. Mrs. C. H. Vary, Pomona, Cal.

TURKEYS.

White Holland Turkey eggs and poults. Two pens headed by magnificent, heavy toms, correctly mated with beautiful hens. Eggs $3.50 per setting. Poults 50c. Bronze Turkey eggs $2.00 and $2.50 per setting. Poults 50c. Richard Eble, Casa Verdugo, Cal. Sunset Glendale 164 J. Rhode Island Red and White Leghorn eggs and baby chicks.

White Holland Turkey Eggs from large, vigorous stock, 35c each. Poults, May 16th, 50c each. Also gobblers, $7.00. Mrs Hocking, Guasti, Cal. Winner of 1st prize, Los Angeles, 1911.

For Sale—Three thoroughbred Mammoth Bronze turkey hens, 1 year old. Good layers and good setters. Address Mrs. Chas. Post, Moorpark, Cal. R. D. 1, Box 25.

Mammoth White Holland Turkey eggs, $3.00 per dozen. R. L. Warren, National City, Cal., R. D. 1.

Mammoth White Holland Turkey Eggs, $5.00 per 13. No better stock anywhere. A. H. Blakely, Ontario, Cal.

FARM LANDS FOR SALE.

Owens Valley offers to the farmer unusual opportunities for diversified farming. With the elevation of 4,000 feet, no fogs, abundance of mountain water running by gravity, a disintegrated granite soil, having been washed from the mountains for centuries, a growing condition is created, the results of which are almost unbelievable.

Alfalfa, as high as four tons to the cutting; timothy with 10-inch heads; from 350 to 500 bushels of potatoes to the acre; as fine Spitzenberg and Winesap apples as grow in Washington and Oregon; a hog, cattle and poultry country that we believe is superior to anything in the State, and, on top of this, the most delightful climate and wonderful scenery.

Surely any farmer figuring on making a change should at least investigate Owens Valley before deciding. Buying a farm is buying a home, and it may be that you will spend the rest of your days on the next farm you buy. Certainly it is worth very serious thought. We want to mail you booklets and pictures, which will tell you a complete story of Owens Valley. The James R. H. Wagner Co., 329 S. Hill St., Los Angeles. Room 10.

40 Acres, near Dinuba, Tulare County, ¼ mile from Southern Pacific, 3 miles from Santa Fe, within 3 miles of three towns; all dry. Accredited high school, telephone, rural delivery. First-class soil, level and under irrigation in best and cheapest irrigation district in this state. Water right with land. Produced 14 tons dried peaches and 25 tons raisins in 1910. 2 acres variety fruits and nuts, over 100 varieties. 2 acres pasture. Plastered cottage, large tank house with 3 finished rooms. Excellent water piped to house and barn. Work shop, fruit, poultry and wood houses. Fully equipped for fruit drying with trays, boxes, transfer fruit car and steel track throughout. Everything about place in first-class shape. $1500 worth personal property. Everything goes with ranch, including furniture. Price $14,000. For terms address owner, Chas. F. Collins, Dinuba, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

Dairy Ranch For Sale—160 acres in San Joaquin Valley; 7-room house, stable, fenced and cross-fenced. Plenty of flowing water to irrigate the 160 acres. 80 acres in alfalfa, balance alfalfa land 12 miles from R. R. Good roads. $100 per acre, ½ cash. Will also sell the cows if desired. Inquire of Geo. W. Berry, of Berry's Market, Whittier, Cal.

For Sale or Trade—230 acres Oregon land in the famous "Rogue River Valley;" fine fruit land, 40 acres cleared, balance in timber; located ten miles from Central Point. A good two-story farm house, large barn. Fenced with 17-wire "Page Fence." Schoolhouse on corner. Would exchange for Los Angeles country or city property, to value of $8,000 or $10,000. Price $65 per acre. Address J. H. Grace, Central Point, Ore. P. O. Box 203.

200 Acres Good Level Land—13 A. orchard; shade trees; 12-room house; 2 barns; windmill and tank house; fruit houses; cream separator; engine; etc. Price $21,000. 12 A. orchard home, good house, 4 rooms and bath, barn, fruit houses, windmill, equipment; complete place. $3600. Yolo & Solano Counties. Wyatt & Wilson, Winters, Cal.

20 Acres, adjoining the Roeding and Wood Nursery land, 1½ miles S.E. of Exeter; best of soil, good location; fine for oranges or lemons. Pumping water at shallow depth, road on both sides, high school. Price $175 per acre, $2000 cash, balance 2 and 3 years, interest 7 per cent net. Fred M. Hart, Exeter, Cal.

For sale—80 acres of land, four miles south of Hanford in the heart of the dairy belt, nearly all in alfalfa. Good buildings, fences and water rights. All checked and leveled. Telephone and rural mail delivery. Address Frank McClellan, Hanford, Cal.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

For Sale—48 acres, all in alfalfa, good buildings, fenced and cross-fenced under the ditch; ¾ of a mile from Newman; $300 per acre. Box 133, Newman, Cal.

Two crops of corn each year can be raised on our lands on the Isthmus of Tehuantepec, Mexico. Farmers: This is what you have been looking for. We can raise other valuable crops besides corn. Prices very low and liberal terms. Write today for our extremely interesting literature about Tropical Mexico. Mexican Isthmus Land Co., Commerce Building, Kansas City, Mo.

Eighty acres finest eucalyptus land, 4 miles from Santa Maria, Santa Barbara County, about one mile from railroad; price $2000, if sold at once. A. Frederiksen, Arroyo Grande, Cal.

For Sale—Orange land in small tracts in Exeter district. Large tract of level, fenced, pasture land. Plenty water. Part cash, terms. Apply Fred M. Hart, Exeter, Cal.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Pacific Coast Lands—Farm lands appraised for prospective investors. Reports on agricultural projects, soils, irrigation, drainage, etc. Paul Goodloe, 1049 Phelan Bldg., San Francisco, Cal.

RARE PLANTS.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

Ahuacates, Alligator Pears (Persea Gratissima). Fresh Mexican seeds, none better for stock; $4.50 per 100 seeds; $40.00 per 1000 seeds. Montarioso Nursery, Box 1500, Santa Barbara, Cal.

Ferns for growing on Adiantum pedatum 5c, Pteris serrulata 3c, Aspidium tsusimense 3½c and 5c. Terms cash. Ballou's Nursery, Pasadena, Cal.

Agricultural Implements—Vehicles.

Splendid values, lowest prices, liberal credit given by our retail department. See us without fail before buying. Catalogues mailed to out-of-town customers. A personal call will show you that we have the best and largest stock in the southwest. We are now doing the largest wholesale business and intend to build up our new retail department. Arnott & Co., established 1892, 112-118 South Los Angeles St., Los Angeles.

For Sale—One 5-passenger Winton auto, extra tires and inner tubes. Also one autocar runabout, fully equipped. M. Jacobs, 201 Howard St., San Francisco, Cal.

Business

ECONOMICAL HAY HANDLING.

Progressive farmers have decided that on account of the scarcity of labor they must depend upon some device other than the common fork to place their crop into the stack. And this fact would be impressed upon one's mind should he happen into the Schmeiser Mfg. Co.'s plant at Davis, Cal., and see a force of twenty men building and loading The Schmeiser Portable Automatic Derrick for shipment to all parts of California.

The influx of homeseekers into Merced County during the past two weeks is unprecedented. Every train brings in colonists who hail from all parts of the Union. Most of the newcomers have been attracted by the opening of a new body of land northwest of Merced on the Santa Fe Railroad.

The new tract, which comprises about 3000 acres of choice alfalfa land, is the fourth opened here by the Co-operative Land & Trust Company. It is known as Merced Colony No. 2. During the first six days after the opening of this colony twenty-one people were placed on the land. Most of them will put their ranches into alfalfa and devote their time to dairying and hog raising.

The new tract is the first of an enormous body of undeveloped land along the Santa Fe in Merced County opened for intensive development. The railroad company plans to co-operate in settling this district, and with that in view will put in a station and siding on the land.

A VALUABLE STORY.

The Los Angeles Times of Sunday, April 9, contained a nine-column illustrated story of the agricultural development which is going on in Arizona. The article is one of the results of the recent visit to Phoenix and the Roosevelt dam by General Harrison Gray Otis, the editor and proprietor of The Times, and it is written in the clear, forcible style for which General Otis is famous. It is, we believe, the most intelligent and illuminating description of this region and of its attractions for investors which has appeared in any outside publication. The Phoenix Board of Trade could not do better than to obtain from The Times, if that be possible, several thousand extra copies of the article for distribution in the East.

The Los Angeles Times is the greatest newspaper in the world, and one of the most conservative—which facts lend additional value to this timely article.

Incidentally, in publishing this most valuable and interesting story The Times has once more shown the genuine friendship for Arizona which intelligent citizens of this Territory know has always animated The Times management. There are benighted people everywhere who can see no merit in a newspaper which does not appeal to their pet prejudices and which does not profess to "believe" as they do. People of this class insist, of course, that The Times is an enemy to Arizona because it does not boost for their "beliefs." But a great number of Arizona citizens admire The Times because it is, as we have already said, the world's greatest newspaper, and because it stands by its principles; and if occasionally they are unable to agree with its notions that fact does not lessen their admiration for General Otis' wonderful paper.—From the Arizona Republican (Phoenix), April 12, 1911.

We referred last week to the $100,000 building with 100,000 square feet of floor space which has just been occupied by the Smith-Booth-Usher Company, of Los Angeles. This great building, with all modern improvements, is located at 228-238 Central Avenue, but we made one mistake in stating that the salesroom of the concern remained at its old quarters on South Los Angeles Street. The salesroom, together with storage and all other features of the business, is now under the great roof of the new building. Therefore, we ask our readers to bear in mind and not go to the old Los Angeles Street location, but to the new one at 228-238 Central Avenue.

General Household Notes

TO THE MEADOWLARK.

Thou tiny, feathered chorister, so brave,
Exultant on the very edge of Spring;
Though clouds are pouring and the winds still rave,
Hark! In a lull, I hear thee blithely sing.
Perched on a topmost bough or rustic fence,
What though around thee dripping skies be drear,
Thou spendest joy with prodigal expense,
And fillest all the air with song and cheer.
Undaunted heart. I would that I might warm
The world as thou, and top with song the storm.

Bright first forerunner of the coming green,
Sprung like a spirit from an empty sky,
While earth is winter-dumb and no life seen,
Then sudden sounds thy joyous minstrelsy.
Thy careless music thrills th' enraptured ear:
Like Pan's pure pipe it flutes unto the skies,
Telling all things, "Soft-footed Spring is here;"
And bidding ferns and violets arise.
Where hast thou learned thy rapturous bubbling glee?
Thou chosen bard of Spring's great victory.

I would that I could live as thou art,—free,
Bird of the open fields and morning-calm;
Without the clog and cramp of tyrranny
By law or custom. Give me that rare balm,
More heavenly than dew, which frees the soul
And bids it soar on wings wher'er it dare;
Let men live godlike free from men's control;
Then shall such heart-songs fret the morning air
As ne'er were heard; rare melodies divine,
With joy as deep, as reckless too, as thine.

—By Charles Erskine Scott Wood in Pacific Monthly.

LUCILE'S DIARY.

I suddenly realized last Thursday morning that I had scarcely 24 hours in which to finish my paper which I was to read to the Dix Amies club Friday afternoon. As I had barely started it I sat down immediately after breakfast to work on it.

Somehow my thoughts did not flow freely. The subject, "The Theory of Household Economics," was too dull to inspire my best efforts. I had succeeded in writing only a sentence or two when I heard the telephone ring. Thinking an interruption might give me fresh inspiration I answered it myself and I was glad I had, when I found it was Lionel Hawley.

"I remember, Miss Lucile," he said, "your telling me how interested you are in water colors and I wonder if you won't come down to luncheon with me and take a look at the summer sketches now on exhibition at our club?"

"Today?" I asked.

"Yes, I'm sorry to give you such short notice, but I never can tell a day ahead when I can leave my office. I simply have to seize any playtime I can get. Can you meet me at 12?"

"Yes, thank you, that will be delightful," I answered.

"Then I ran down to the kitchen where Cousin Fannie was doing up the morning work, for it was Tilly's day out.

"Cousin Fannie," I said, "I have to go downtown today and I don't see what I'm to do about my essay unless you take pity on me and finish it. You know, it is absolutely necessary that I have it by tomorrow."

"I write your essay, Lucile!" Cousin Fannie exclaimed.

"Yes, why not? You have to be at home anyway today and I'm sure, Cousin Fannie, dear, you have a much better understanding of household economics than I have. This is a good chance for you to express your splendid ideas. It will be real missionary work for you to write out some of your experiments and deductions for the benefit of the Dix Amies club girls."

"Do you really think it will be right for me to do it?" she asked.

"Yes, indeed," I answered, heartily. "So that's settled. Thank you ever so much for your generosity."

That day, while we were lunching and during a pause in the conversation Mr. Hawley drew a big English penny from his pocket and said, "Thoughts, please?"

"I was just thinking," I replied, "how frightened I shall be tomorrow at our club when I rise to read my paper on "The Theory of Household Economics."

"Are you interested in that subject?" There was a note of surprise in his voice.

"Indeed I am. Don't you think every woman should be?"

"I most certainly do, but I am afraid a great many young women never bother their pretty heads about the matter."

"I'm aware that there are frivolous women who shirk their natural responsibilities," I said, smiling, "but you mustn't think we are all in that class just because we happen to like pretty clothes and enjoy the gifts the gods provide."

"Just to show you how glad I am that you are the kind of girl who includes domestic art in her tastes," declared he, "I'm going to send you some flowers to wear when you read your paper, if you will so honor me."

I really think Mr. Hawley is one of the nicest men I know. He has such beautiful manners. The huge bunch of violets he sent me was the envy of all the Dix Amies girls.

"Really, Lucile," said Louise Edwin, who has a crude way of making uncalled-for suggestions, "you have enough violets for all ten of us."

"Yes, perhaps," I replied glancing down at the fragrant blossomc, "but I'm going to give them to some one who doesn't receive many flowers."

"That's very sweet of you, Lucile," said Arvilla Wren.

I felt glad that I had resolved to present them to Cousin Fannie to take to her mission school, for I always like to give her pleasure when I can. But it happened that evening that David Robinson came in unexpectedly with theater tickets, and of course, having the violets on, I could not very well take them off before going to the theater. I am sure he wondered who sent them to me, for I saw him looking at them several times.

When I had finished reading my paper the girls of the Dix Amies gathered around me in an excited little group.

"Why, Lucile," said Mary Towns-

J-M ASBESTOS ROOFING CAN NOT BURN

Impartial tests made by Fire Chiefs, City Council representatives, and hundreds of other disinterested persons, prove that J-M Asbestos Roofing cannot be burned even by the flame of a blow-torch—a flame which is intense enough to melt iron. This is a test many times more severe than any roofing is ever put to in actual use.

This ready-to-lay roofing consists of several layers or sheets of Asbestos (stone) Felt inseparably cemented together with genuine Trinidad Lake Asphalt—the two most indestructible things ever discovered. It contains nothing that can rot, rust, melt, crack or in any way deteriorate. Even gases, acids, and chemical fumes do not affect it.

There are hundreds of buildings on which this roofing has been in service for more than a quarter of a century without a single cent's worth of paint or repairs.

Isn't this the kind of protection you want for your buildings?

J-M Asbestos Roofing is suitable for all classes of buildings—barns, factories, dwellings, etc., whether they have a steep or flat roof. Comes all ready to apply, with nails, cement and full instructions for applying, packed in each roll.

If not at your dealer's, our nearest branch will sell you direct; also apply it, if desired.

This Wonderful Stone Sent FREE

Imagine a real rock from which you can easily pull long thread-like pieces that are almost as soft and pliable as a silk thread, yet so indestructible that they can't burn, and you will have in your mind's eye a picture of the wonderful Asbestos Rock as near as words can paint it. But words cannot describe this marvelous rock. So we'll send you a sample free, for we know it will convince you better than anything we can say that J-M Asbestos Roofing, which is made of this indestructible rock, must also be practically everlasting.

Write our nearest Branch now for sample of Crude Asbestos and our handsomely illustrated Book L55

end, "no one ever suspected you of possessing so much domestic wit and wisdom. Your essay is delightful."

All the other girls complimented me also and asked so many questions that I was really confused. I think Cousin Fannie should have been more specific in her quotations and figures, for it was most embarrassing for me to have to acknowledge that I could not remember the names of certain authorities quoted in the paper.

"Lucile," said Louise, "you really should follow up this paper with a series on the same subject—only more in detail."

"Oh, no; I've bothered my family enough about this one," I laughingly protested, for I felt that it was only right thus to give credit to Cousin Fannie for her assistance.—Ex.

RAISINS.

Selma Raisin Pie.

Wash thoroughly two cups each seeded and seedless California raisins; soak several hours in cold water. Stew until tender. Then add one cup crushed walnut meats, one-half cup sugar, two tablespoons butter, two tablespoons cornstarch; rub to a cream with juice and rind of one orange and one lemon and part of grated rind, and cook until slightly thickened. Cool, and bake with a double crust.

Fowler Raisin Pie.

Beat yolks of three eggs and white of one, keeping the remaining two for frosting. Add one cup sugar, one cup cream, sweet or sour (sour preferred); one-half teaspoon cloves, one cup seeded or seedless California raisins. Bake in rich pie crust in slow oven. When done, beat whites of two eggs until stiff; add two tablespoons granulated sugar. Place in oven and bake until light brown. This will make one pie.

Sanger Raisin Pie.

One and one-half cups each California seeded and seedless raisins, three cups water, two tablespoons butter; juice of one lemon, juice of one orange, one-half teaspoon cinnamon and cloves mixed, one tablespoon flour dissolved in water. Bring all to a boil, add flour dissolved in water. Sufficient for two pies.

Clovis Raisin Pie.

Chop one and one-half cups seedless or seeded California raisins, one tart apple, one-half slice stale bread. Put in saucepan with one and three-fourths cups boiling water, one-half scant teaspoon salt, one-half cup sugar into which has been stirred one heaping teaspoon flour, one-half teaspoon cinnamon, one-fourth teaspoon cloves. Let cook ten or fifteen minutes, and before putting in crust add juice of a small lemon or sour orange.

Mock Mince Pie.

Two cups Sultana raisins (1 lb.) one-fourth cup vinegar (good), three-fourths cup boiling water, one-half cup sugar, one-fourth teaspoon cloves, one-half teaspoon cinnamon, one-fourth teaspoon allspice or nutmeg, little salt; chop or grind raisins, add three-fourths cup boiling water and cook ten minutes. Mix vinegar, boiling water, sugar, salt, spices and boil until it becomes a syrup. Combine syrup and raisins and let cool slightly. Make a rich pie crust.

Fresno Raisin Pudding.

Soak and slightly stew one cup each seedless and seeded California raisins. One and one-half cups sugar, two cups grated raw apples, one cup crushed walnut meats, one-half cup sifted bread crumbs soaked in one-half cup sweet cream or milk, two tablespoons butter, nutmeg and cinnamon to taste, two eggs beaten separately. Mix thoroughly and bake in pudding dish in moderate oven for twenty-five minutes. Serve with whipped cream.

Raisin Rice Pudding.

Thoroughly cleanse cup of rice, put in stewpan with one pound California seeded raisins, and about three pints water. Cook until well done and water boiled out. Add more water if necessary to cook rice. Make custard of two beaten eggs, two cups milk, and one-half cup sugar. Mix with hot rice and raisins, adding one pinch of salt, and put into baking dish in moderate oven, baking about thirty minutes.

Raisin Graham Pudding.

One cup each milk, molasses and California seeded raisins, two cups graham flour, one teaspoon soda, a pinch of salt and spice to taste. Steam two hours. Serve hot with lemon sauce made as follows: Cream one cup sugar and one-third cup butter. Beat one egg in cup and fill cup with cold water. Mix all together and cook until it comes to a boil, but do not allow it to boil, stirring constantly. Set off stove and add juice of one-half lemon.

Prize Raisin Buns.

One and one-half quarts flour, one cup yeast, one-half cup sugar, one egg, half cup butter, pinch of salt, a little grated nutmeg, mix into thick pancake batter with sweet milk which has been scalded and cooled to blood heat. Let stand in a warm place, well covered till very light, usually takes from three to five hours, then add flour enough to make a good biscuit dough and add two to three cups California seeded or seedless raisins, washed and dried. Mix well and let rise again till light. Roll out like biscuits, cut with biscuit cutter and put into greased pans to rise. When light brush with a little sweet cream and sugar and cinnamon and bake in hot oven fifteen minutes. Better than cake or pie for children.

Raisin Fudge.

Two cups sugar, one cup milk, butter size of egg, one-half cup chocolate; cook, stir continually until bubbles break slowly. Add one-half pound walnuts and one-half pound California seeded or seedless raisins. Stir until stiff and pour into buttered pans. When cool cut into squares.

Raisin Panoche.

Two cups brown sugar, one-half cup milk, one tablespoon chocolate. Let boil until when dropped in cold water will form soft ball. Take from fire and stir until becomes like cake dough. Then add one teaspoon vanilla, one-half cup chopped walnuts, one-half cup California seeded or seedless raisins. Stir until creamy and spread quickly on buttered tin. When cool cut in squares.

Raisin Sandwich.

Chop one cup California raisins and one cup walnuts very fine; add three tablespoons mayonaise and one teaspoon lemon juice. Mix into paste, spread on thinly buttered bread. Splendid luncheon sandwich.

Society Sandwich.

Delicious for afternoon teas, picnics and children's lunches. Chop fine one cup of seeded raisins, together with one cup of nuts (preferably walnuts), mix with whipped cream or the white of an egg beaten, season with salt. Spread between slices of thinly buttered bread cut very thin.

Raisin Salad.

Two cups California seeded raisins,

Pioneer Roofing

—best by every test

The Popularity of **Pioneer Roofing** is due to its **wearing** qualities. We want to go on record right here and now with the positive assertion that a "Pioneer Roof" will outlast **two** ordinary roofs. The first cost is little if any more than you would have to pay for roofing of inferior quality. And once a "Pioneer Roof" is on, there is no further cost. It requires no paint or repairs.

Pioneer Roofing is made in several weights; suitable for residences, hotels, outhouses, business blocks; anywhere that a sunproof, rainproof roof is required. Comes in handy rolls. Easy to lay. No special tools needed. Everything necessary will be found in the center of each roll, for which there is no extra charge.

Free Booklet and Samples

The mauufacturers of Pioneer Roofing have published a 32-page booklet, which is effectively illustrated. The booklet is both interesting and instructive. It tells how to lay roofing—and what weight or thickness of roofing is best suited to the various kinds of buildings. The booklet and samples of roofing will be mailed free upon request.

Pioneer Paper Co.
247-251 South Los Angeles street
Los Angeles, California.

If your dealer does not carry Pioneer Roofing—notify us, and we will see that you are supplied. Address Dept. 11.

The sun should not set upon our anger, neither should he rise upon our confidence. We should forgive freely, but forget rarely. I will not be revenged, and this I owe to my enemy; but I will remember, and this I owe to myself.—Bacon.

two cups sliced apples, one cup sliced celery (fine), one cup walnuts, one tablespoon sugar, one-fourth teaspoon salt, one cup whipped cream. Serve warm at once.

Raisin Ice Cream.

There is no finer fruit ice than California seeded raisins added to ice cream of any flavor. Thoroughly dissolve finely chopped or ground raisins in the milk before putting in freezer. Use one pound raisins to each one-half gallon cream.

MANNERS AT HOME.

"Isn't it funny?" said a girl in a college boarding hall. "At home, when anyone is through eating, she gets up and goes; here we are expected to ask to be excused."

Manners at home are not what they should be unless the mother keeps the family up to the mark all the time. Too many college girls and boys are absolutely lacking in the little refinements which indicate good breeding. One objection offered to college training for their children by farmers is that a college only teaches a child to look down on home. It is true that children who are being taught how to conduct themselves with consideration for those about them will notice the lapses in language and manners of the home folk, but we should not permit those lapses in ourselves. Good breeding should be a part of the boy or girl. They may have to follow a model at first, and assume the breeding which they have not, but it will soon become second nature to do the right thing at the right time; to respect themselves and others.

Children do not thank their parents for neglecting to teach them the principles of good breeding; on the contrary, they censure severely the parents who were too hard worked and too busy to secure the best development of their children.

The farm boys and girls in this country have opportunity for filling the highest places in the land. Do not think because you are finding difficulty in meeting the rent on a farm now, and keeping the children clothed and fed, that it will be always so. The future may hold a position of responsibility for which each one should be ready. Some of our great men have had atrocious manners, but they were great in spite of tnem, not because of them. Remember Ella Wheeler Wilcox's poem, and be guided by it:

"I may not reach the heights I seek,
My untried strength may fail me;
Or half way up the mountain peak
Fierce tempests may assail me.
But though that place I never gain,
Herein lies comfort for my gain:
I will be worthy of it."
—Wallace's Farmer.

Prayer is for the mountains,
Laughter for the plain,
Song for the greenwood,
A lass for the lane;
They come as God wills,
But He keeps the blue hills
For the heart still fain.

Dreams for the river,
Longing for the sea;
Yet sorrow's all my pillow
Wherever I may be.
'Tis all as God wills,
But there's rest in the hills—
So there lay me.
—Charles T. Rogers.

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, April 26, 1911.

Butter.

Demand in excess of receipts has caused a cent advance in butter, and the market is very firm.

Prices to trade 2½c in advance of the following Produce Exchange quotations:

Extras	21
Firsts	20
Ladles	18
Country	14

Cheese.

Oregon Daisy	16½
Northern	14@16
Domestic Swiss	18
Imported Swiss	32

Eggs and Poultry.

A material advance with firm market prevails.

An important change in the rules covering the purchase and sale of eggs was made at yesterday's session of the Produce Exchange of Los Angeles. Jobbers in the future will pay 3 cents under the case count for pullet eggs when the quotations range from 20 to 25 cents, 4 cents off when the range is from 25 to 30 cents, and 5 cents off when the price is more than 30 cents. In case the buying price is below 20 cents, 3 cents will be deducted for all pullet eggs.

Heavy losses suffered by dealers through their inability to dispose of pullet eggs at the same quotations which the larger varieties brought was the principal reason for the change. Under the former ruling, dealers, when selling pullet eggs, were compelled to specify the pullet variety, and as a result the smaller eggs were taken only by the poorer class of trade at a price several cents under the market quotations. It has been the plan to buy pullet eggs on the same case count as the large eggs.

Paying price f. o. b. Los Angeles is:

Local ranch candled	24
Case count buying price	20
Northern	18@22
Eastern	20

Dealers pay for live poultry f. o. b.

Dark comb	12½
Extracted white	8
Extracted dark	6½
Beeswax, lb	24@30

Hay.

Scott, Magner and Miller say:

Arrivals of hay for the past week have been 2,558 tons. This is 1,000 tons less than the preceding week. The market the last few days has shown a slight improvement, and a little more inquiry for choice lots. Several sales have been reported from the country during the week, and holders in the interior are stronger in their prices, we believe, owing to the fact of the north winds which have been blowing for several days, many of the farmers claiming same have affected their crops very materially, and that they will not cut nearly as much as heretofore figured on. As this same condition shows itself nearly every year when the north winds blow for a day or two, we are not prepared at this writing to state whether or not the crops have been materially injured, but believe if we have rains in due time that the effect will be over come, as is usually the case, but we must admit that north winds at this time of year without being followed by rains are very serious to the crops in general. Therefore it would not be surprising if hay should do a little better should the rains hold off for any length of time.

Alfalfa is moving off slowly—no de-

mand for stock hay. Straw remains the same, with very light demand.

We quote the wholesale prices in round lots on today's market, as follows:

Fancy wheat	13.00@13.50
No. 1 wheat or wh and oat	10.00@11.00
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.00@11.00
Other tame oat	7.50@9.50
Wild oat	7.00@9.00
Stock hay	5.00@6.50
Alfalfa, ton	9.00@10.50
Straw	40@50

Grain.

Barley, fancy	1.50
Barley, good to choice	1.46¼@1.48¾
Barley, poor to fair	1.40@1.45

Cocoanut cake, ton	22.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	27.00@27.50

Citrus Fruit Market

LOS ANGELES, April 26, 1911.

With as high as 225 cars of citrus fruits going forward daily, the market is holding especially strong. The quality of the fruit seems to be acceptable to the Eastern trade. Present shipments are carrying better than earlier, and nearly every car is iced. Some concern is manifested by the orchardists because of dropping, which, with a few puffs, is causing some loss. The distribution of the orders, however, holds back the desire to unload too quickly.

Severe storms and extreme cold weather in the Mediterraneon sections is giving strength to the lemon market, and the former good prices are not only held but advanced slightly. Full reports of the damage done are not at hand, other than that it is a most severe blow to the industry of those countries.

Shipments.

Shipments of oranges to date since November 1, 1910; 22,382; lemons, 2,688; total, 25,070. To same date last season: Oranges, 14,829; lemons, 2,152; total, 16,981.

LOS ANGELES, Monday, April 24.—One car navels and one car sweets sold.

A TREATISE ON PUMPS.

One of the most interesting, and withal the most tantalizing catalogs that has come to our desk in many a day is that of the Geo. E. Dow Pumping Engine Co., devoted to agricultural pumps. The cover design represents an orange orchard under irrigation, with the foothills and mountains in the distance. When held in a certain light the silver glint of water can be seen in the ditches. Harder still to see are the snow-covered slopes of the mountains. At first glance the mountains seem bare, but when caught in the proper light the glint of snow can be plainly seen. Nor is the cover the prime factor of interest. The reading pages set forth in a brief way the principles governing the choice of different types of pumps to meet various requirements in agricultural pumping. This company, as is well known, manufacture a wider variety of pumps than any other manufacturer in the world. This gives their engineers wide knowledge, and their customers great latitude in determining the proper installation to secure the best results. Alternate with pages describing Dow pumps are pages containing information expressed in clear terms enabling a practical man to figure the required sizes of ditches, pipes and pumps for different conditions. Much good advice relative to the proper considerations, and particularly in the matter of dollars and cents, governing the installation of a pumping plant, is given in their advertisement appearing in this issue. It will pay to read this advertisement carefully and apply to your own ranch the analysis there laid down.

AUCTION

40 Fine Saddle Horses

FASHION SADDLE LIVERY

623 WEST 12TH ST., LOS ANGELES, AT 10 O'CLOCK A. M. THURSDAY, MAY 4.

On account of dissolution of partnership, Kerner & Kollas have instructed us to close out to the highest bidder without reserve their High-Class Saddle Livery and Equipment, consisting of 40 Head of Choice Saddle Horses, from 5 to 10 years of age, all gaited Saddle Horses, most of them high-class single footers; several of the above are first-class drivers. This is undoubtedly the best lot of saddle horses in California, sound and handsome, nearly all gentle for ladies and are city broken.

50 First-Class Saddles and Bridles, including Stock Saddles, Missouri Cushion Saddles, English, McClellan and Whitman Saddles, Saddle and Stable Blankets, Riding Habits; in fact, all equipment of this high-class Saddle Livery.

If you are in the market for First-Class Saddle or Combination Horses, do not fail to attend this sale, as owners have instructed us to dispose of same on above date positively without limit or reserve.

TERMS, CASH. For full particulars inquire of Auctioneers.

KERNER & KOLLAS, Owners.

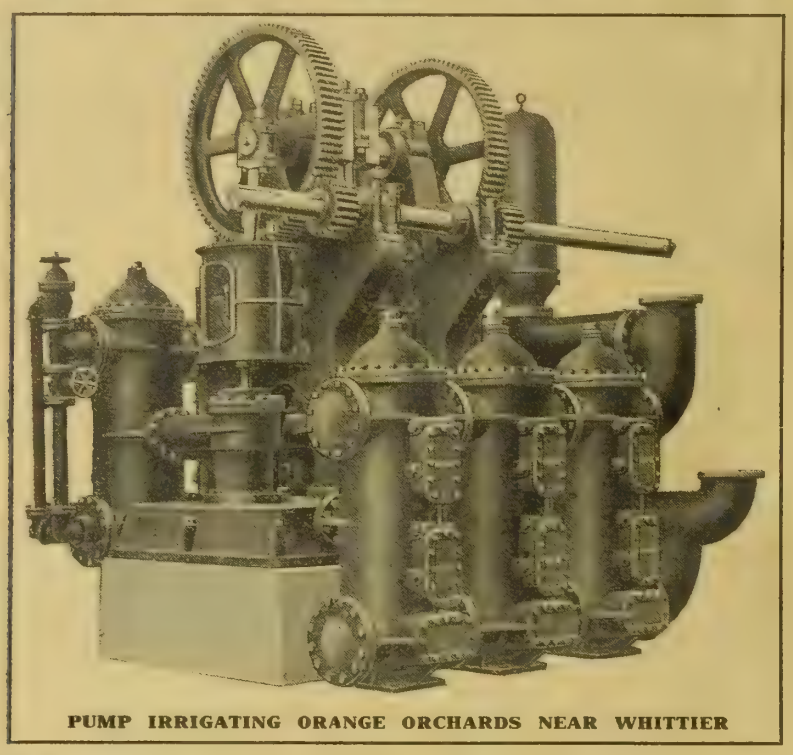
The Installation of a Pumping Plant for Agricultural Purposes Involves Two Important Investigations: *Engineering and Financial*



PUMP IRRIGATING ORANGE ORCHARDS NEAR WHITTIER

Engineering . .

The engineering features include the development of a sufficient water supply, the best method for getting the water to the point of distribution and the best means for distributing it. The pumping plant is the connecting link between supply and distribution. On the reliability of this plant depends the reliability of the entire system. However well the water supply or distribution system be built, on the successful running without stoppage or other interruption, depends the success of the entire ranch. For this reason great care should be exercised in the selection of machinery for pumping, and that the correct type for your condition is chosen.

Financial . .

The financial investigation is by all odds the most important.

First: to determine the additional income derived from the land after installation of the plant.

Second: because the less money expended in running the plant and keeping it in order, the greater the net profit.

Engineering judgment may indicate a plant costing more than you have determined on spending. Another outfit may come within your allowance. An investigation of the cost of running may show a difference great enough to pay for the higher-priced plant in a short time. Or, you may have in mind a plant with many special devices. Investigation may show that your condition can be met with a rig slightly different, and with a marked saving in first cost. Points like these require careful study, and are best determined by men who have had experience with many types of pumps.

Dow Service . .

The Geo. E. Dow Pumping Engine Co. are the largest manufacturers of pumping machinery and compressors on the Pacific Coast, and the only manufacturers building their pumps complete from foundry to delivery. The various demands on them to meet all conditions have resulted in a line of pumping machinery and compressors containing more types than any other manufacturer in the world. The many conditions encountered have given their engineers a broader view of pumping needs than those of any other manufacturer. In advising the use of certain pumping machinery they are not bound by the limitations of one particular line or type. They are in a position to draw on a vast fund of experience and select the type best suited to the engineering and financial conditions under consideration. The services of this engineering force and this factory are at your command. As an aid to you in the selection of proper pumping machinery a new booklet called

ACRICULTURAL PUMPS

has been published. A copy will be sent on receipt of your name and address.

Dow Pumps . .

A few of the types we build are:

Centrifugal pumps for irrigation and reclamation service.

Triplex pumps for use where cost of power is an important factor.

Air compressors for pumping water containing large quantities of sand.

Deep well pumps for pumping water from wells in the most economical manner.

Portable pumps for use in wineries, dairies, or wherever a portable pump is required.

We are prepared to furnish these pumps in any size and driven by the method best suited for your conditions.

If you are considering a pumping plant you will profit by consulting us.

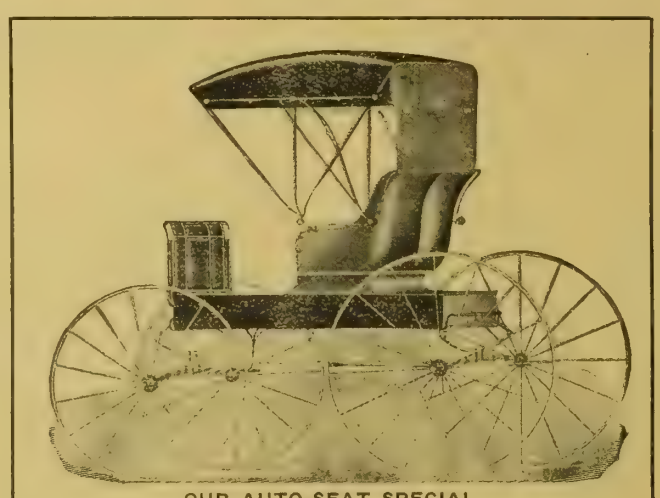
The Old-Fashioned Way of Making New-Fashioned Buggies

IT MAY COST MORE BUT IT PRODUCES BUGGIES that last---buggies that give satisfaction and long wear. You'll find old-fashioned quality and old-time manufacturing methods in all the up-to-date work of

THE ARNOTT "Built-to-wear" LINE



OUR AUTO-SEAT SPECIAL.

Like other dealers, we sell an Auto-Seat Special.
But we believe our Auto-Seat Special is better than the average—far better.

It possesses all the special features in shafts, wheel, gear and top construction that have made the "Built-to-wear" Line famous for strength and durability.

And in addition, the style of the auto-seat is far superior to others. In the first place, our seat has a hip measurement of from 1½ to 2 inches more than any other on the market, insuring comfort to the greatest degree. We make a feature of "leg-room" also, and the combination presents a job that is unexcelled; it hits every buyer in his most vulnerable spot.

Write for our catalogue and let us tell you more about this big leader, more about this quick-seller, this leading member of the "Built-to-wear" Family.

Write for catalogue showing the new line of Arnott "Built-to-wear" Surreys. Prices and styles will show you a new way to save money.

"BUILT-TO-WEAR"—that's the Arnott slogan. It represents the standard that, for many years, this concern has set for itself.

We've **had** to live up to it. Selling buggies that would last longer, look better and give greater satisfaction has been the one big thought during the course of this concern's up-building.

When other dealers were cutting quality in order to cut prices, when they were forsaking the old-time, thorough-going methods that meant strength and durability for new, and more or less slip-shod, processes in order to cut labor costs and reduce manufacturing costs and to gain a big out-put, this concern, believing honest manufacturing and an honest product to be more important than costs and retail prices, has gone ahead along its original lines and is selling work that honestly comes up to the "Built-to-wear" slogan.

We pay attention to the "little things" of buggy construction that other concerns pass by as unimportant, but which we **know** result in producing the kind of buggies that our grandfathers bought, and which lasted and gave splendid service for years and years.

The Arnott "Built-to-wear" Line is not behind the times—it is ahead of most other lines. In style, in new improvements it leads in every direction. But quality—good, old-fashioned, honest workmanship and materials are put into every job that those who buy may have more than one hundred cents of satisfaction for every dollar they invest.

Write us to-day for catalogue, prices and liberal terms.

Recent Discoveries Regarding Graft Hybrids

Written for the Cultivator by Dr. J. Eliot Coit,
State Pathological Laboratory, Whittier

In the horticultural literature of the past century there are records of many discussions between eminent horticulturists regarding the mutual influence of stock and scion. In a large number of these graft hybrids are mentioned as notable instances of the influence of stock on scion.

Ordinarily, when we speak of a hybrid plant we have in mind a seedling which has resulted from the cross-pollination and fertilization of two distinct species or genera of plants. Walnut trees which have sprung from black walnuts cross-pollinated with the Persian walnut are known as hybrids and are common examples in California. Very often the characteristics of the hybrid are intermediate between the two parents, but sometimes they may closely resemble one parent only, the characteristics of the other parent being hidden or "recessive." Seedlings of hybrids usually show a great degree of variation.

In 1825 M. Adam, a French horticulturist, in nursery grafting Cytisus purpureus on Laburnum vulgare, found that in one case the resulting shoot was intermediate in character between the stock and scion. This new form was thought to be a "graft hybrid," was named Laburnum Adami, and has been propagated by grafting until this day. The seeds of L. Adami, however, always produce seedlings of L. vulgare, the yellow-flowered parent. A similar combination was later produced between the medlar and haw and named Crataegomespilus. The Bizaria orange is also thought to be a similar combination between Citrus aurantium and C. medica.

In 1907, however, Hans Winkler, a European botanist, published a paper which opened up an entirely new method of investigation. Winkler resolved to produce a graft hybrid under experimental control, and with this in view made a large number of grafts between the common tomato and the nightshade. After the scions had taken he made transverse cuts along the line of union in the hope of causing adventitious shoots to arise from the point of union in such a way that the tissues of both the stock and scion would be involved in the production of the new shoot. His efforts were finally successful, but when the long-desired shoot was studied it was found not to be a graft hybrid, for one side of the shoot was tomato and the other side nightshade. If a branch put out through the tomato side, tomatoes would be produced, and if from the nightshade side, nightshade berries would result.

In some cases where both kinds of cells were mixed throughout a new branch, even extending to different parts of the same blossom, the kind of plant the seed produced would depend upon whether the egg cell in the ovary was of tomato or nightshade origin. As the tomato and nightshade will not cross sexually, there was no chance for real hybridization. Winkler called this kind of a mixed plant a chimera.

Continuing his experiments, Winkler produced other forms which he concluded were real graft hybrids. Through the researches of Erwin Baur, however, it has been found that he was mistaken, and that there are at least three kinds of chimeras: (1) hyperchimeras, where the cells of stock and scion are mixed together without any apparent order throughout the new plant; (2) sectorial chimeras, where the proportion of stock and scion making up the new plant is represented by sectors on the cross-section of the stem; and periclinal chimeras, or where one component invests the other as a mantle.

Baur studied the well-known Laburnum Adami and found it to be a periclinal chimera with an epidermis of Cytisus purpureus and a body of Laburnum vulgare. Baur found, also, that geraniums with white margined leaves were parts of a periclinal chimera, and, furthermore, that practically all of the supposed graft hybrids on record are chimeras of one kind or another.

Baur, therefore, while solving the botanical riddle of the century (Laburnum Adami), has opened up a new and exceedingly interesting field for study. We have become accustomed to think of a grafted plant as one with a root of one kind and a top of another, and it is somewhat unsettling to our habits of thought to consider, for instance, Winkler's tomato-nightshade mixtures, in some of which both kinds of cells were intimately mixed together throughout the length and breadth of the top and (as the chimera shoots were cut off and rooted as cuttings) the roots as well. In such a plant it is evident that neither part can be designated as stock or scion, for they have reached a far more intimate association. If there is a mutual influence between stock and scion, what will be the ultimate result of the mutual influence of the diverse cells making up a periclinal chimera, for instance? These and dozens of other questions crowding behind them certainly indicate that an exceptionally interesting field has been opened up by Hans Winkler and Edwin Baur.

Possibly a New Profit Winner for California

Carica Papaya, Sometimes Called Melon Papaw, has Promise of a Future in this State. It now grows in Texas, where Winter-Protected.

An article which was published in The Cultivator of March 2d referring to the medicinal qualities of the Carica papaya, as grown in Peru, has caused some interest and a number of inquiries have been received as to the worth of this particular fruit and its possible adaptation to California conditions. A letter was sent to the Foreign Seed and Plant Introduction Service of the Bureau of Plant Industry for fullest information and we have a letter from Mr. Peter Bisset, expert of the Bureau, enclosing a photograph showing a plant now growing in Brownsville, Texas, raised from seed obtained from the Ben Gut Province, Philippine Islands; also photograph of a bunch of fruit on a plant in the Subtropical Garden at Miami, Florida. The Brownsville tree we reproduce on this page, the other being very similar is not shown. The Brownsville plant "was protected through the winters by the use of corn stalks and ripened all of the fruits the following summer.

"Carica quercifolia, another member of this family, has stood the winters at Chico, California, where it has been exposed to a temperature of 18 degrees, and has borne fruit abundantly. We have not had these fruits analyzed, however, and therefore cannot state how valuable they are in the manufacture of pepsin.

"On my visit to Southern California last year I saw one or two trees growing at Hollywood but was told that they had never borne fruit. This may be due to the fact that these are male plants. As you no doubt know this plant is dioecious and it requires both staminate and pistillate flowers before any fruit can set."

Regarding the more particular description of the carica family Bayley's Cyclopedia says: "Small trees mostly with unbranched trunks, the juice milky. Leaves near the top of the trunk, alternate, large and variously lobed, soft, long-stalked; plant usually dioecious: flowers in racemes from the leaf axils, the staminate funnel shaped and bearing ten anthers on the throat, the pistillate larger and with five distinct petals and one pistil with five rayed stigma. There are about twenty species in tropical America. They have somewhat the aspect of palms. Under glass in frosty countries the common carica papaya is frequent, and is grown for its foliage and interesting habit. In frostless countries this species is grown for its fruit, which is oblong or egg-shaped, a foot or so long, orange-yellow when ripe, thick-skinned, with many small black seeds. The young fruit is cooked and eaten and the ripe fruit is eaten by natives.

"The soil most suited for caricas is a rich loam having perfect drainage. As the stem is succulent and tender great care is necessary to avoid bruisings; hence pot-grown plants are much to be preferred to seedlings from open ground. Seeds should be selected from the best and largest fruits and sown in a well-stocked bed under a slight shade. If seeds are quite dry or old they should be soaked in warm water before sowing. The seedling plants are delicate and require close watching at first to prevent damping-off. As soon as plants are well up, remove the shading and after a third leaf appears they may be pricked out into a larger bed, or better, potted off in fairly rich soil. After plants are a few weeks old and have been shifted once into larger

(Continued on Page 554.)

THIS TEST REVEALS THE HIDDEN WEAKNESS IN ROOFINGS

All ready roofings—except J-M Asbestos (stone) Roofing—are made of so-called felt composed of animal or vegetable fibres. When these fibres were growing, they lived upon the ground or animal from whence they came, and received their life therefrom. So every fibre of this nature is hollow, like a straw.

These felts are water-proofed with coal tar, asphalt and oil, or other volatile compositions which quickly evaporate when the sun reaches them. Therefore, the sun quickly begins its deadly work of taking these oils off the surface of such roofings; and then continues to draw them out of the inside through the strawlike fibres of which the felt is composed, until the roofing becomes dry and porous and is no longer water-proof.

J-M Asbestos Roofing is unlike other roofings, because its felts are made of stone fibres which are *solid*. These *solid* stone fibres defy the action of the sun's rays and positively prevent capillary attraction, thus hermetically sealing all of the oils so they must remain to do their duty indefinitely.

J-M ASBESTOS ROOFING

is not merely *one* sheet of water-proofed stone felt, but *several* layers cemented together with nature's wonderful water-proofer—Trinidad Lake Asphalt. This asphalt is also hermetically sealed, making any escape of oils or asphalt impossible.

Prove for yourself that sun will soon destroy the water-proof quality of ordinary roofings. Focus the rays of the sun through an ordinary sun or magnifying glass and note results. This, in ten minutes, will show you what sun will do in a few months.

This simple sun-glass test is as severe in its way as our famous blow-torch *fire* test. It will show up the short-comings of a roofing *before* you pay out your money.

Because of its stone nature, J-M Asbestos Roofing also never needs painting, and is fire-proof, acid-proof, rust-proof and rot-proof.

Most hardware and lumber dealers sell J-M Asbestos Roofing. Sold direct, and applied if desired, where we have no dealer. Write our nearest Branch to-day for sample of the curious Asbestos rock from which this roofing is made, and our handsomely illustrated Book No. N 55

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Our finely illustrated booklet, "Citrus Fruits," covering the industry from the seed to the market, mailed to any address on receipt of 25c in stamps.

SAN DIMAS CITRUS NURSERIES

San Dimas California

The Roessler & Hasslacher Chemical Co.

100 Williams Street, New York. Works: Perth Amboy, N. J.

CYANIDE of POTASSIUM 98-99%, CYANIDE SODIUM,

Equivalent to 128-129% Cyanide Potassium, for generating Hydrocyanic Gas

The only positive eradicator of the **San Jose Scale, Red** and **Black Scale** and other insect pests.

Citrus and Tropical Fruits

GROUND TEMPERATURE.

An interesting question which has been raised for years, and especially since green manuring has prevailed, is as to the effect at time of extremely cold weather. Many have insisted that cover crops prevented radiation of heat from the soil, so that orchards with the green covering would show a lower temperature and at the same the shading of the ground during the sunny portion of the day would prevent the ground's absorption of the sun's warmth. It is an interesting question and should cause investigation. Dr. W. F. Sutherst, in charge of agricultural work at the Bonita Union High School of the Lordsburg and San Dimas districts, has made some interesting experiments, which he has kindly furnished to us. As we take it, his ground temperatures are taken by the bulb of the thermometer lying above the surface of the ground or above the surface of the mulch where it covers the ground. Dr. Sutherst writes:

"I have been taking ground temperatures of orange orchards in the neighborhood of the above school, to see what effect green manuring and straw mulching had. The following results were obtained:

	Minimum on Soil.	Minimum on Vetch.	Minimum on Straw Mulch.
Feb. 7.....	34°	34°	31°
Feb. 8.....	34°	34°	31°
Feb. 9.....	32°	32°	30°
Feb. 10.....	28°	28°	25°

"You will see that the minimum temperature on straw mulch is about three degrees lower than on vetch or bare soil."

One peculiarity of the above figures is that there is absolutely no difference in the minimum on the bare soil and on the soil covered with vetch. We would think that the latter would show a higher temperature, especially if its temperature were taken in the morning after a night of radiation. We think a more instructive test would be as to the temperature of the atmosphere a few inches above the soil or above the growing vetch or mulch. We are inclined to think that clean culture, and especially a freshly cultivated orchard, will give a higher temperature to the atmosphere than under any other conditions.

INSECT CONTROL.

Speaking on the subject of insect control before the recent State Citrus Growers Convention at San Bernardino, Prof. A. J. Cook called attention to the need of more competent workers among the inspectors who have to do with enforcing county and state laws. He maintained that among the qualifications for a first-class horticultural commissioner, he should be a thoroughly trained mycologist and entomologist and able to discover the ills and enemies of plant life, and fully informed on the laws which he is to enforce. As to necessity for very highest efficiency in this work, Prof. Cook says:

"It is a fact that must be patent to all that no citrus orchard can do the large service which we expect and usually secure, except it be in full health and vigor. We ask of our groves a colossal task, that of giving to us a maximum crop each year. This requires that they be in perfect condition as to health and strength. One of the most patent causes of lack of vigor is the presence of the great host of sappers and miners, our insect foes. Any decadence that may be noted may very likely be justly charged up to this fact, that insect despoliation is rife in the orchard.

"It is just as true that fungoid troubles which are more difficult of detection, and more likely to be neglected also, claim very heavy toll from our citrus growers. If we may judge from the experience in old orchards in other parts of the world, we may rest assured that this matter of pestiferous fungi will be in the future a close second to that of insect pests as an impediment to success in citrus culture. We have long known of apple scab, and bitter rot in the apple, and yet only yesterday did we get at the bottom facts, even if we have reached them at this date.

"Again, we have all observed that insects and fungi alike are coming more thickly and are working more viciously as the years go by. For years, at Claremont, we had only the black scale to fight; now we have four other insect foes, full worse to handle, at our very doors. Rot and withertip now keep the bug pests company, and bid fair to keep the orchardists awake of nights. You will all agree that these pests are not becoming less, but are crowding in upon us in most alarming fashion."

As to the needs of the commissioner's office, Prof. Cook adds:

"The office of commissioner of horticulture is one of colossal importance, and its proper manning means thousands of dollars in your pockets, as does unfitness as great loss. Again good men can be had, and it behooves each one of us to bend all our energies to secure the fit man in each county. When we find that such a man is at service, let us back up every effort that he may make to secure to us a scale-free county. Just imagine how the real estate man would dance with joy if he could truthfully say our county is scale free, and would we not joyfully all join in the dance?"

THE ORANGE TORTRIX.

By H. J. Quayle, Southern California Laboratory, Whittier.

The orange tortrix (Tortrix citrana Fernald) was first described in 1889 by Professor C. H. Fernald from specimens bred from oranges from Southern California by Mr. D. W. Coquillett. Complaints of it have occurred from time to time since, but with the exception of occasional years it has not occurred in sufficient numbers to attract much attention. According to Coquillett, considerable inquiry was made about the insect in 1894, and also again in 1898.

During the season of 1909-10 this insect was the cause of no little concern in certain sections of the Southern California citrus belt. It seemed to be most abundant in Los Angeles County from Glendale to Pomona, very few being seen further east in the Riverside-Redlands district. In some of the packing houses during the early part of the shipping season the amount of wormy fruit ran between 5 and 10 per cent.

Coquillett states that "ordinarily it lives in a rolled or folded leaf, upon which it feeds, but it also has the

habit of burrowing into the green oranges." This latter habit of burrowing into the fruit really seems to be the most common. Very little evidence of rolled or folded leaves was noticed in the infested groves, and the worms kept under observation in the laboratory seemed to attack the fruit in preference to the leaves.

This insect appears to attack a wide range of food plants aside from the orange. Coquillett (loc. cit.) states that it occurs on apricot, willow, oak (Quercus agrifolia), wild walnut (Juglans californica) and golden rod (Solidago californica). On July 24 specimens of larvae were received from Mr. I. J. Condit, of San Luis Obispo, which were attacking green house plants. Moths were reared from these and submitted to Dr. L. O. Howard at Washington, and were identified by Mr. August Busck as Tortrix citrana Fernald. Mr. Condit states that they have been infesting various greenhouse plants for several years, but have not spread out of doors except to some geraniums close by and to various plants in the lath house. The greenhouse plants listed are: "Wandering Jew, rose, seedling acacias, seedling eucalyptus, asparagus sprengeri and A. plumosus, lavender, Jerusalem cherry, pentas, cineraria, lantana, coix lachryma, begonia and ferns of various species. Pelargoniums were especially subject to attack, and the larvae seem to work into the tips and branches of these plants similar to a borer. Commonly they work in folds of leaves tied together by means of silk threads."

The injury to oranges is due to the burrows made in the fruit, and usually these go no further than just through the rind. There is considerable variation in the character of the burrows, both as regards size and the depth they go into the fruit. Of course such fruit is classed as culls, and the holes are frequently the source of infection for decay following blue mold, navel end rot, and withertip fungus. The burrows in the fruit also cause it to drop prematurely, especially if the fruit is still small, so that all of the injury chargeable to this insect is not accounted for in the packing house alone.

The eggs are laid on the leaves, either the upper or lower surface, but more usually on the lower, and also on the fruit. They are laid in masses of from ten to thirty-five, overlapping one another like shingles. An individual egg is cream color, measures about .75 mm in diameter, disc shaped, slightly convex on upper surface, and with a distinctly marked hexagonal network discernible with hand lens. Two or three of these masses may be laid by a single moth, so that the total number of eggs may vary from twenty-five or thirty to seventy or eighty. At the end of six days the two black eye spots of the developing larvae are visible, and hatching occurs six days later.

The young larvae are active and wriggle quickly away on being disturbed.

A considerable amount of web is spun, and the portion of the orange entered is sometimes covered with a thin network of silk. Larvae in the insectary chose to enter the orange on the under side where it was resting on the surface. One entered alongside a cell which had been attached by paraffin to the fruit. In the field, the most usual place of entry is where two oranges are in contact or an orange and leaf are in contact.

The full-grown larva is about one-half inch long. The color varies from greenish white to dark gray, with broken irregular stripes more distinct in the darker specimens. During the growing period of the larva it remains almost continuously within the fruit, but upon reaching maturity it wanders about over the cage at night. During the day it is always found in its burrow. This traveling about off the fruit is no doubt for the purpose of finding a suitable place for pupation. In case no favorable location is found, it will pupate within its burrow, first making a slight irregular cocoon. Pupation within the burrow is, in fact, very common, though other places may be selected if available. The total length of the larval life is from fifty-five to sixty days, and the pupal period from nine to twelve days in midsummer.

The number of broods in a season is not very well defined, and there is more or less overlapping. There does appear, however, to be a period in the spring when the moths are abundant, and again in the early fall. Moths were common in May and the first part of June, and practically none were seen in July and August. Moths appear again in September, and possibly also again about December. Judging from the appearance of the worms and of the moths, there are probably three generations, or two with a partial third generation.

Two species of Braconids (species not yet determined) have been reared from the larva. As for control measures, spraying with an arsenical has been suggested, but the worms would have to become more abundant than they have thus far to make this practical. The most feasible measure seems to be the picking up and destroying of dropped fruit in the field, while the larva is still within its burrow, and also the destruction of the wormy culls as they are sorted out in the packing house.—Journal of Economic Entomology.

HOW TO DISCOVER WHITEFLY.

It is not always easy to discover the presence of whitefly when it is first beginning to infest a grove. The winged adults may have disappeared (died), and there may be only a few larvae present, perhaps only one on a leaf here and there. It is at this stage of infestation, however, that drastic measures for its control should be adopted in order to check its rapid spread. While nearly all fourth-stage larvae are now readily visible to the unaided eye, earlier in winter and during fall many were still so thin and transparent that it was difficult to see them. But even now the following manipulation for loosening and making them more easily visible is very useful.

To loosen the larvae (not to remove them) simply grasp the end of a leaf with the thumb underneath and forefinger on top, turn it over, stretch it taut, and rub the free finger of the hand holding the leaf along the lower side. It is surprising how many more larvae can frequently be made visible by this means, and the whitefly traced far beyond the suspected limits.—Florida Grower.

How wonderful is the chemistry of nature. Different trees feeding upon the same soil and the same air will produce different products. The oak gives the acorn, while another tree gives us oranges, another apples, another pears, peaches, plums. How marvelous is nature—Green's Fruit Grower.

Deciduous Bush-Tree Fruits

STORAGE IN TRANSIT.

Answering request for information as to what "storage of apples in transit" means, we may say that it is a method of storing urged by the International Apple Shippers Association and described by that association as follows:

"Apples, carloads, from any point shown in tariff, may be shipped to any intermediate point, placed in storage, and afterward reconsigned on protection of through rate, under the following provisions:

"A. The storage point must be an intermediate point in the same general direction between point of origin and final destination, except that no charge for back haul will be made, when ultimate destination is in the same general direction, or storage point is in territory intermediate via any route from point of origin to final destination.

"B. Storage must be in warehouse furnished by shipper, or owner of property. The carrier not to assume charges for storage, insurance, or other expense accruing at warehouse.

"C. Shipments entitled to storage in transit privilege shall have their expense bills at the storage station stamped. 'To be stored in transit.'

"D. The surrender of paid expense bills accompanied by warehouse certificate identifying said shipment will be a declaration by the shipper that said shipment is entitled to transit privilege.

"E. Shipments may be stored in transit for a period not exceeding nine months, but in no case is privilege to be extended beyond July 1 following.

"F. Upon surrender of paid inbound expense bills, shipments will be rebilled from storage point to final destination, plus a switching charge not to exceed $5.

"G. The through rate in effect on date of shipment from point of origin shall be the rate to be protected.

"Much work has been done by this committee, and as a result the number of associations working for the privilege is continually increasing, and the railroads themselves have taken an increased interest in the matter. The Central Freight Committee, located at Chicago, has voted in favor of granting this privilege. This committee acts in an advisory capacity to the Central Freight Association, comprising all the transcontinental lines entering Chicago, and from this center the movement would be expected to extend to the transcontinental lines entering New York. In addition, prominent banking interests on the Pacific Coast are actively at work urging the Western lines to grant this relief.

"It is conceded that within a few years the states of the Northwest will have to market 100,000 cars of apples annually, as against the 15,000 cars of the present time. This is a tremendous increase and presents a problem difficult to solve.

"Some of the reasons why this storage in transit privilege should obtain are given in the words of Mr. Loomis, as follows:

"'The great trouble with the movement of the crop of box apples in a satisfactory way has been the lack of facilities for distribution. The crop is moved in a month and a half; it requires nine months of the year to consume it; storage facilities must be provided at the most favorable points to hold this crop during that period of time and to allow it to go to any market that most needs the supply. At the present time the box apple crop is congested at Chicago and New York, and no efforts are being made to increase the consumption of box apples at other cities. According to the proportion of wealth, half the box apple crop should be consumed in the East, between Chicago and New York. At the present time only one-quarter of the crop is being there consumed. The granting of this privilege would particularly stimulate the demand in the many large cities between Chicago and New York. It would greatly benefit the railroads in an increased amount of traffic, especially on the Eastern lines between Chicago and New York, probably to the extent of a million dollars annually.

"'It would also greatly benefit the growers of box apples in providing a systematic scheme of distribution; it would allow their crop to be marketed where it is most wanted, and also by scattering it among the cities of the United States prevent a glut or congestion in any one market. It would in addition greatly help all the cold storage warehouses at all cities on transcontinental lines, and would particularly place on a prosperous basis the warehouses at Chicago and those in Western New York. The latter would be assured of full houses on any short year.

"'In addition, it would greatly help the apple industry. At the present time competition is concentrated in one or two sections. With this privilege, capital would be induced to invest in box apples on equal terms with barreled apples, and thus it would be distributed throughout all apple sections, thereby tending to greater uniformity and stability.'"

BAD FARMING.

When will farmers brace up to the consideration of preserving the fertility of their soil? No matter what crop is grown, there is a constant evidence of a decline of productive power in the land. It has always been supposed that the legume plants, like peas, beans and the clovers were the least exhausting on the land of any, but here comes Mr. R. M. Ballard, an extensive grower of peas in the eastern counties of Wisconsin, who says that he will be obliged to seek new fields for this industry because of the rapid failing of fertility in the old pea sections.

This is simply the old story of selling out the farm by the bushel or the ton. Farmers must take into consideration the ever governing fact that every crop, no matter what, exhausts the soil of some of its elements of fertility and if they are wise unto its salvation, they will pay back to the land in special fertilizers some of the revenue they have received from it.

Let that be considered a fixed charge to be met every year. The final effect will be that in a few years the farmer will have under his feet, a strong resolute soil that will answer back to him in good crops in almost any season. These are the ever present considerations: Drainage for the surplus water; humus to hold the natural and necessary soil moisture and the nitrogen; ground limestone to correct the growing acidity of the soil and furnish what lime is needed by the clovers, including alfalfa; phosphate for the grain; potash for its share in the general economy of fertility.

Now, if any of these conditions and elements are wanting they must be supplied. That is plain, common sense, else down goes the productive power of the land. That means future loss to the farmer. Too many farmers are like the man who said he could get rich on the proceeds of his labor if it did not cost so much to keep up the machine in food and clothing. It does cost something to keep up the productive power of the

land. And the beauty of it is that the farmer in reality is no poorer for it. He has kept up the production, and consequently the selling value of his property. There is no poverty or hardship in that.

Those pea farmers in Wisconsin are not different from the wheat farmers in Minnesota, or the corn farmers in Illinois. They are now confronted with the judgment of an outraged soil. Because the judgment is deferred, many think it will never be levied. But it will. They are like the Irishman who was caught stealing a pig. The owner, an old Quaker, said to him, "Thee will pay for this on the Judgment Day." "Troth," said Pat, "If I'd knowed yees was going to wait as long as that for your pay, I'd taken two."

What is needed is the spirit and pride of good farming. We must trust ourselves to the well-settled principles of good farming, assured that if we do, we will "make our calling and election sure." No country ever prospered by an impoverishment of the soil.—Hoard's Dairyman.

RED SPIDER ON ALMONDS.

Mr. Harry P. Stabler, county horticultural commissioner of Sutter county, advises the application of sulphur to almond trees when leaves first appear and again later. Mr. Stabler says:

"On almond trees the first sulphuring should be done as soon as the leaves appear in March. A second application is advised from the 1st to the 10th of May. Prune trees should be treated as soon as the spider appears. In Sutter county this occurs about the first week of July.

"Full grown trees require about a pound of sulpnur which should be thoroughly distributed throughout the foliage. The old method of throwing a handful of sulphur in the crotch of the tree, or on the ground under the tree is valueless. The use of a blower is economical in large orchards, but a can with perforated bottom is frequently used on young trees or small orchards.

"In normal seasons the spider is easily controlled by dry sulphuring. When the pest does not yield to this treatment a spray is recommended."

CO-OPERATION.

"The excessive toll paid to cross the bridge between consumer and producer is today the chief cause of complaint of high cost of living, on the one hand, and failure of the producer to share justly in the profits of his labor on the other. How to reduce this toll has been, and is today the great economic problem. It is generally conceded that the only way to selve this problem is by co-operation —meeting combination by combination. Notwithstanding the many failures, some progress has been made and good work is still going on. But there are many difficulties to overcome. In this connection, I will quote from the last report of the Master of Kansas State Grange:

"'The fruit raisers of California are writing to us often wanting the Grange supply houses to purchase their fruit direct from them to save the expense of so many middle profits; but under the present system of business we can not do it and the reason is discrimination against both the producer and consumer.

"'We can buy California fruit from the commission firm in Kansas City in small lots as we use it cheaper than we can buy the same fruit from the fruit grower in car lots. The system arranges things that way.

"'The manufacturers are organized; the jobbers have combinations and the retailers in the town have an understanding and in the cities an iron-clad combination, and the result is that the farmers are underpaid for their produce and the consumer is overcharged and the only remedy is to increase your numbers in the Grange and establish co-operative exchanges.

"'The National Grange has taken this matter in hand and has a committee from Maine, Pennsylvania, Indiana, Illinois, Missouri, Kansas and California. The committee realizes the difficulties before it, but it is possible to establish produce exchanges, which will grow into a system that will cheapen transportation and eliminate so many intermediate profits, and be a benefit to both the producer and consumer.'"—The Grange.

ESTIMATES OF APRICOT CROP.

D. Felsenthal, Buckhorn, Ventura County.

The older trees in this vicinity are very much spotted, some trees have enough while others in the same orchard are bare. The younger trees will yield about as last year. On the whole I should say the apricots in this district of the year would be about 65 per cent of last year's yield and of a fine size.

Aratus Everett, Moorpark, Ventura County.

In vicinity west of Moorpark, two and one-half miles of the main valley, apricots were badly hurt by frost. This with cold rain, east winds, etc., reduces the crop prospects to about one-fifth of an average crop. North of this valley in the foothills and the Simi Valley the crop may be better than half of an average crop, which might bring the average in the county south of the Santa Clara River up to one-half of an average crop. The average of the whole county will be about one-half of an average crop. Our county has recently been canvassed for organization of dried fruit association and above results ascertained. In this locality there will not be nearly as many cots as last year.

G. H. Waters, Pomona, Los Angeles County.

Pomona valley has about half a crop of apricots. The peach crop is setting very heavy with every indication for a full crop. All kinds of berries are in bloom and looking well. We have no prunes to speak of any more, as the orchards have been mostly dug up. Pomona valley never looked better.

A. S. Shively, Santa Paula, Ventura County.

From the very best information we can get, the crop will go from one-third to one-half of what we had last year.

DIFFERENT KINDS OF MANURE.

The relative value of manure placed around trees, as observed by experiments, ranks as follows: Hens, hogs, sheep, cattle, horses. A hay mulch six inches deep is almost equal to stable manure and cultivation. To obtain color in its deepest and richest aspect, wood ashes applied around the trees in late fall or early spring will produce the desired effect.

The bean growers are slow in signing contracts for the coming crop, as every promise is for good prices.

SULPHUR

BRAUN CHEMICAL CO.

San Diego LOS ANGELES Bakersfield

Winsel's May Garden Calendar

VEGETABLE GARDEN. Sow Beans, Peas, Sweet Corn, Cucumbers, Melons, Squash, Beets, Carrots, Cabbage, Lettuce, Parsnip and Radish. Our Peas, Beans and Sweet Corn are of the best Northern grown stock. All our seeds are raised by the best specialists in their line.

Plant Onion Sets and the roots of Rhubarb, Asparagus and Horseradish, and set out the plants of Cabbage, Cauliflower, Shives, Tarragon, Pepper, Tomatoes and Celery. We have a good supply of all these plants on hand.

FRUIT TREES. Plant Oranges, Lemons, Grape Fruit, Loquats, Guavas and all evergreen fruit trees. Send your orders to 211 South Main Street, or visit our nurseries, S. W. Corner Washington and Figueroa Streets, Los Angeles, and select your trees.

FIELD GROWN ROSES. Two years old. These plants were lifted from the open ground the first of the year, and are now thoroughly established in six-inch pots. We have a complete assortment of varieties best adapted to Southern California. Price, 35c each, $3.50 per dozen. We prepay freight to any point in Southern California on orders of one dozen or over. Send for our rose list.

LAWNS. Put in your lawns with our Kentucky Blue Grass and White Clover seeds. We carry the best grades only.

FLOWER GARDEN. Sow the seeds of Asters, Sweet Peas, Coreopsis, Centaurea, Alysum, Poppies and Pinks. We have on hand the following plants that can be set out now; Gaillardia, Verbena, Pansies, Violets, Asters, Lobelia and Althernantera at 25c per dozen, $1.50 per hundred.

SHEEP MANURE. Free of weeds and odorless. Gives immediate results. Delivered anywhere in Los Angeles, Pasadena or Hollywood at $2.25 per hundred pounds.

LANDSCAPE GARDENING. Estimates and plans furnished.

OUR FREE NEW CATALOG. Giving directions how and when to plant everything. Tells about flowers, vegetables, fruit trees and ornamental stock, and also contains a plan for a semi-tropical garden, and how it should be planted in Southern California. The only book of its kind free for the asking.

DWARF MILO MAIZE
A DRY LAND CROP

Where the rainfall is limited or water is expensive there is no more profitable forage and dry feed crop than **Milo Maize.** It belongs to the sorghum family of tropical Asia and Africa, where it is the principal grain grown.

We have secured a stock of a dwarf variety that has been thoroughly tested in Southern California and Arizona, yielding two and one half tons of grain per acre. It grows a stalk 4 to 5 feet high with large, compact, erect heads, and stock especially like the sweet flavor of the stalk.

Write for cultural directions and prices.

Dwarf Milo Maize and Red Kaffir Corn

The two great drought resisters should now be sown. There is no more profitable dry land crop than these two members of the sorghum family. We have taken particular care in selecting acclimated seed stock of the true dwarf varieties, yielding two to three tons per acre. Write for samples and cultural directions.

WEST COAST CHICK FEED

They can't beat it. Nothing better for the little ones. 100 pounds, $3.25. If not sold by your dealer, we pay the freight within 100 miles.

Garden and Field Crops

THIS MONTH.

By O. M. Morris.

Spring is now on us with its rush of work in everything pertaining to the garden. Hoeing and cultivating of crops already planted and the planting of new crops, make this one of the most busy months in the season for the amateur as well as the professional gardener. Unfortunately the cold weather of the second week of April will cause many of the early plantings of tender stuff to be planted over again, but this is only one of the many trials of the gardener. Potatoes were badly nipped, but in most cases only temporarily hurt, and will again in a few days be up and growing as the "reserve eyes" will fill the place of the lost growth in a short time. The greatest loss probably was in tomatoes and vining plants, such as cucumbers, melons, etc. These will have to be replanted where they were lost. Great quantities of tomato plants are a total loss and the supply is very short.

Sweet potatoes are now in good demand, with only limited supply, but later they will be plentiful and good yield can be had from these planted up to June 1st.

During this month all manner of seeds can be planted. Look after the melons, cucumbers, beans and all seeds planted in the open and if stand is not good, replant at once so as to secure perfect stand. Bean planting in the large acreage sections will be on in a few days. Early snap beans are also being planted. Among the popular bush varieties Stringless Green Pod probably stands first with Early Six Weeks closely following. Mohawk and Refugee are quite popular in some sections and of the wax pod varieties, Ventura Wax and Black Wax are most popular among the bush varieties, while among pole varieties nothing is so popular as Kentucky Wonder Green Pod, but Kentucky Wonder Wax is gaining much favor and is quite as fine and preferred by some. These two varieties are grown without stakes, on large scale, but for small plantings poling is best and they are more easily picked, without injury to the plant.

Corn.

Both sweet and field corn are now being planted. Of the sweet corns, probably Oregon Evergreen is the most popular, with White Mammoth Evergreen and Stowell's Evergreen and Country Gentleman about equal. These are all large varieties and not near so early as Golden Bantam, Peep-o-Day or Early Cory. These three last varieties are very early and probably Golden Bantam is the most popular. A new corn introduced last year, the Howling Mob, is quite early and an excellent medium early. Unfortunately the best of all earlies, the Heath's Early, is all cleaned up and supply is exhausted. This we believe to be the sweetest corn grown. Of field corns, the Yellow Dents in several varieties lead, with Hickory King, the large white a great favorite, the Yellow Flint, King Philip, is also a popular early variety.

Tomato, egg plant and pepper plants have been more scarce this season than for years. The long wet season caused much loss of plants from "damping off" and consequently a brisk demand for plants, all over this section, especially for early varieties. It is not too late, however, to plant seed again.

Melons, especially the musk melon, has become extremely popular of late years, and like lettuce has grown into universal favor. Not many years ago a few hundred pounds was sufficient to supply the nation, while now the seed crop runs into hundreds of thousands of pounds. California supplied over two hundred thousand pounds of lettuce alone.

The most popular musk melon for the market on a large scale is the Netted Gem or Rockyford, but only as a shipping melon. It surely lacks flavor and is so very small, it is not popular as a home garden variety. The Tip Top, Pineapple and Model far excel in flavor, and the Tip Top beats them all in localities where it succeeds. The Chilean watermelon still leads the list for market, with Kleckley's Sweet as a home variety. As melons, cucumbers and like tender vining plants require heat, they can be planted for a month yet and produce a good crop. Casaba melons can be planted any time up to July.

Onions are a prontable crop and can be planted most any time of the year and require about six months to mature. Australian Brown is probably the most popular for planting now, Bermudas for July and August.

BREEDING NEW PLANTS.

New purposes are constantly entering into the breeding of plants. We are producing maize with extra high content of starch and other forms, with high content of oil. The Germans breed potatoes for alcohol production and other fruits for extra long shipment. We have peas and sweet corn specially adapted to canning. We are beginning to breed for disease-resisting qualities. The United States Department of Agriculture is working on a wilt-resisting cotton and watermelon, a rust-resisting oat, and similar things. The North Dakota experiment station is producing a disease-resisting flax. The Maine and Vermont experiment stations are investigating the subject of blight-proof potatoes. We shall probably breed blight-resisting pears, disease-free ginseng and blight-proof tomatoes. We already have a wilt-resisting and nematoid-resisting cowpea, although not the result of direct breeding. We are constantly giving more attention to securing plants that have the desired qualities inherent in themselves rather than in obtaining these qualities by means outside the plants.—L. H. Bailey, in Century.

NAKED SNAILS OR "SLUGS."

Lettuce, and other plants, in the cold-frame, greenhouses or gardens, are sometimes troubled with these slimy creatures, which, by the way, are not insects in any stage, but snails without shells. The writer has killed them in his own cold-frame by sprinkling upon them with a sprinkling can clear and quite weak lime-water, made by slaking a little quicklime, possibly two or three pounds in five gallons of water. This in no way injured the lettuce, or impaired it for table use. Only the clear liquid was used, not the "milk of lime," and whenever it touched a snail the latter "gave up the ghost" immediately. The mere presence of this lime-water in the soil appeared to be disastrous to snails, and one or two applications were all that was necessary in the cases referred to.—F. L. Washburn, Div. of Entomology, Minnesota University Farm.

Busy asphalt-diggers in Trinidad Lake

Natural asphalt is the life of

Genasco

the Trinidad-Lake-Asphalt Roofing

And natural oils are the life of Trinidad Lake asphalt. They do not evaporate when exposed to sun and air like the oils of coal-tar and other residual pitch roofings. This is why Genasco does not crack and leak and go to pieces. It stays *lastingly* waterproof.

Mineral or smooth surface. Fully guaranteed.

The **Kant-leak Kleet** waterproofs the seams of roofing without dauby cement, and prevents nail-leaks.

Ask your dealer for Genasco with Kant-leak Kleets packed in the roll.

Home Grounds Beautiful

THIS MONTH.

By O. M. Morris.

The flower garden should have its share of attention this month and all manner of annuals can be planted, such as centaureas, snapdragons, asters, phlox, larkspurs, marigolds, candytufts, coreopsis, etc., are highly recommended and hundreds of other species and varieties. The above are all good for cutting and should be grown liberally. The biennials are also to be planted during the spring months for blooming next spring; the Canterbury bells, Sweet Williams, etc., and such varieties of perennials that bloom the first year from seed, as delphiniums, perennial Canterbury bells, carnations, dahlias, Brompton stocks, salvias, perennial asters, aquilegias, anemones, foxglove, petunias, daisies, verbenas, etc., should be planted as nearly as possible to have a good season of bloom. Those species or varieties of perennial that do not bloom first year, can be planted later and be large enough to bed out in early spring.

LATH HOUSE HINTS.

All winter long the lath house has seen its owner pass by to plant potatoes and peas, to hoe and to spade, to work in the open and the sunshine, and it has worn an air of dejection, but now there is a stir in its shady depths. Everything is starting the season's growth, and the gardener will be among his ferns.

The sun is gaining power every day and when the north wind blows evaporation is very rapid. See that potted things and hanging haskets do not suffer for moisture. A rain that will wet the ground for a couple of inches or more will often leave pots and baskets perfectly dry. Once either of these really dry out, they must be submerged in a vessel of water to get moist all over again, and it really seems that with plants a drying-out habit can be formed.

The warmer nights will bring out the slugs and other plant enemies to riot among the tender fronds of the pushing ferns. Visit the lath house with a light, a miner's electric lamp is excellent, and catch the villains in the act. Slugging is most unpleasant but most necessary, and conditions that make for good fern growth invite a slug population.

If you have tree begonias planted in the ground in your lath house, top-dress them with well-rotted cow manure. They are surface feeders and tend to get up out of the earth into the dry, and then find they made a mistake, for they want moisture at the roots all their growing season. Be sure and put out some tuberous begonias as advised last month.

About now there will probably be some putting up lath houses, so that the following suggestions are offered. Build your lath house big enough to accommodate yourself and a few friends as well as the plants. Leave a protected side, preferably the eastern, open. Have a height of twelve feet if possible, and then your choice climbers can be inside instead of on the roof. Make a feature of your posts. Why not have four feet or so rough rocks and concrete to accommodate ferns, etc.? Run your lath on the roof north and south, to better distribute the sun's rays that filter through. Have a central dome if you can accommodate tall things. Put in lots of hydrants; the hose in the lath house should be short and light. Have a little addition for potting and storage of all the tools and paraphernalia that are indispensable but very untidy.—California Garden.

NEW YORK'S EASTER LILIES.

New York's Easter lilies are largely shipped in from the Bermudas. Only those who have been fortunate enough to have visited Bermuda at the time when the vast fields of lilies are in full bloom can realize the rare beauty and fragrance of these lovely flowers, for with acres upon acres of their snowy blossoms spreading away as far as the eye can reach, and the caressing tropic wind wafting the heavy fragrance across one's nostrils, the effect is almost intoxicating. It is a rare and wonderful sight, and one never to be forgotten, for nowhere is the lily so beautiful as in its native islands under the bland and tender skies of the semi-tropics. The flowers are bigger, purer, sweeter, and the sunshine of the islands is so dazzling clear and white that it fairly glorifies the lilies bending on their graceful stems.

The lilies are shipped from Bermuda in three forms—the bulbs, the budded plants, and the cut flowers, this last named form having been employed only of recent years, the fast express service making it now possible. The lily plants are shipped in huge crates, and the florist pots them upon their arrival, carefully "feeding" them for several weeks before putting them upon the market. The plants are received in various stages of growth, the last shipments before Easter being of plants in full bloom, ready for an immediate market.

BAMBOOS FOR SOIL BINDERS.

Having request for bamboos which would make dense growth and at same time be good soil binders along banks of streams, we wrote to Mr. Peter Bisset, Expert Plant Introducer of the Bureau of Plant Industry, as to best varieties for this purpose. He writes:

"We have quite a number of varieties of the bamboo that would be well adapted for this purpose, amongst the best would be Bambos veitchii and Bambos palmata, both of which varieties grow close together, forming dense mats. The veitchii grows to a height of from one to two feet, and the palmata, to a height of from two to four feet. They have long underground rhizomes that spread rapidly and form very good soil binders as well as undercover crops.

Should a larger growing variety be desired we know of nothing better than the Bambos moso, which is one of the large growing timber bamboos of Japan. Sufficient time has not elapsed since the introduction of the different varieties we have at Chico for us to state definitely just what they are best adapted for.

Until one has seen a really well grown, so-called Papyrus, or umbrella-plant, one cannot realize its decorative possibilities. Like the calla, it likes plenty of water to stand in.

Water potted plants by standing them all night in two or three inches of water.

Commissioner Makes Good

No state in the Union has given the attention to horticultural quarantine and protection of its fruit and other products from the depredations of insects and fungi that California has. With the state horticultural commission and its deputies and employes in many sections of the state, and with most of the counties of the state conforming to the state law and maintaining county commissions, all sections are fairly well guarded. We say they are well guarded, and this is true theoretically, though it must be admitted that in some counties results have not justified the expense. In contrast, others show results most remarkable. We believe this latter class, however, may be counted easily upon one's fingers. We would not discourage the work being done under the county commission law because of some of these failures or partial failures. The effort is in the right direction, and where politics has been obliterated promise is given for proper results from the funds expended. In some counties results have not been what they should, because of lack of harmony between various producers rather than lack of ability on the part of the commissioner and his helpers.

It was our pleasure recently to inspect one county where harmony and ability unite in accomplishment of remarkable results. It is not a big county, though it is big in some of its products. For instance, in lemons it produces over 200,000 boxes valued at well up towards a million dollars, oranges a couple of millions, dried apricots over five million pounds valued at nearly a half million dollars. Walnuts again is where it shines in the production of practically 4,000,000 pounds valued at nearly a half million dollars, and when it comes to Lima beans it is the greatest county in the state and the greatest producer of any small section in the world.

As agriculture, or more particularly horticulture, predominates, its board of supervisors, not one member of which is a farmer, yet with keen business judgment, picked a young man fresh from college who has an ambition to make his county the cleanest in the state. We refer to Ventura County, whose commissioner is Mr. E. O. Essig. The board of supervisors has granted to the commissioner practically every request for supplies and appliances. His central office is located in Santa Paula, not the county seat, but in the center of the producing section of the county, and this office is thoroughly fitted with cases containing specimens of insects and fungi, a fairly complete library, almost perfect filing appliances, and incubators for developing fungous growths, nearly everything needed in a laboratory for original investigation.

In return for this confidence manifested by the board of supervisors, Mr. Essig has given his days to work in study and inspection in the field and his nights to work in the laboratory, and the result is that for original research and actual accomplishment we do not believe there is a commission in the state superior. Especially along the lines of withertip and mealy bug investigations has Mr. Essig been persistent. We do not recall any man or body of men that has gone after the matter as he has. This work has been treated of more at length in former Cultivators; the carbolic spray which is proving so successful is the result of Mr. Essig's investigations.

The orchards of the Little Santa Clara Valley are practically all thrifty and well cared for. This little valley, but a few miles wide, extending from the northern end of the Southern Pacific tunnel in Los Angeles County through Ventura County, bending toward the ocean near the little city of Ventura, is one of the prettiest in the state of California. The orchards are watered either from the Santa Clara or its tributaries coming down from the mountains along the eastern side of the valley. The section about Santa Paula is largely devoted to lemon and apricot culture, though the English walnut groves cover many acres. Plantings of the last few years are more given to citrus than to deciduous fruits, and while some apricots are still being planted, we believe there are a far greater number of walnut trees being uprooted to make way for lemons than are being set out. The thrift of citrus trees was manifest on all sides, though in occasional in-

E. O. Essig.

stances the twig ends give evidence of the withertip fungus. The withertip has lost its terror now, for it has been proven both by work conducted under the direction of Mr. Essig and others that the application of Bordeaux is abundantly able to care for it; it is simply a question of carefulness on the part of the operator.

In the matter of red spider control we saw work being done in the large orchards of the Teague McKevett Company, and it was easy even for the layman to see the vast difference between trees recently sprayed and those not sprayed. Scarcely a leaf could be picked from the latter that was not covered with myriads of eggs and young of the red spider, while on the sprayed trees many leaves could be examined without detection of a single insect. The best part of this treatment is that it is economical. The ordinary commercial sulphur-lime mixture, 2½ gallons to 100 gallons of water, is used. Mr. Essig assured us that this was an absolute remedy for the red spider. Formulas for the Bordeaux mixture and the carbolic have been given in former Cultivators. The carbolic acid mixture has been successful not only on mealy bug but many other pests, and it, too, is a remarkably cheap mixture.

Part of the day was spent on the great Limoneira ranch, with its 3,000 rich acres, of which 520 acres are in lemons, 450 acres in walnuts, and the balance in beans, hay and grazing land. It is a beautiful ranch, a profitable ranch, because given the very best of care. A visit to such a place is an education which other fruit growers should avail themselves of.

PROFIT WINNER FOR CALIFORNIA

(Continued from Page 547.)

pots, they may be set permanently outdoors in the tropics. Caricas seldom branch but usually grow upright like a palm, hence cuttings are not often available. Sometimes small branches form, and these may be cut off and as readily rooted as most tropical decorative plants, providing the cutting is not too young and tender. In temperate climates caricas have been found to be good decorative plants for both conservatory and summer bedding, the deeply cut, palmate leaves forming a striking contrast to ordinary vegetation. In budding out select open, sunny exposure with perfect drainage and make the soil rich and friable. Constant cultivation with a light hoe will cause a luxuriant growth under these conditions, and the planter will be amply repaid for his trouble by beautiful, showy specimens as unique and tropical appearing as palms."

The melon papaw is described by Bayley as having a "trunk reaching twenty feet, leaves often two feet across, palmately seven-lobed, fruits six to twelve inches long and half as thick, hanging from the lower axils of the pistillate plant. It is a native of tropical America but has been widely naturalized, growing spontaneously in the wilds of southern Florida. The fruit is used as a vermifuge and a cosmetic. The juice of the fruit or the macerated leaves, if rubbed on animal flesh, makes it very tender. It is best to roll the meat and leaves together for a few hours. The fruits are made into sauces or conserves and are sometimes eaten raw."

The Cultivator of April 21, 1910, contained an illustration of one variety of this fruit growing in the Hawaiian Islands. As this tree appears to be much larger than the one illustrated herewith, we take it that Hawaiian conditions are very favorable to growth of this species.

"RUNNING OUT" IN POTATOES.

Every farmer is perfectly familiar with the fact that if a good herd of Shorthorns falls into the hands of a stockman who feeds them as the average farmer feeds his stock, there will be a rapid decline, in each successive generation, from the former high standard of the herd.

Every farmer is also aware of the fact that if a stockman, who has brought a herd of Shorthorns up to a high standard of perfection, discontinues the selection of the best animals for keeping up or improving his herd, it will "run down" rapidly from generation to generation.

Just as surely as these two factors —namely, good feeding and selection —are necessary for keeping a good herd of Shorthorns from "running down," so are they necessary for keeping a farmer's potato-seed stock from running out.

The ideal feeding standard for potatoes should be such as will produce not less than 200 or 250 bushels per acre, and preferably more. This requires a soil that is, first of all, fertile, and, secondly, in a good condition for the roots to gather plant-food from. In addition, the plants must not be overrun with weeds, and the bugs must not be allowed to get away with the crop. The fertilizing can be accomplished by rotation of crops and manuring. A rotation which supplies a clover sod, or a sod of clover and timothy, one or two years old, is generally best for the potato crop; the only exception being that found in some cases where some other crop is grown on the sod, to be followed by potatoes. The manure can be applied to the sod at any time, during the year preceding the potato or other crop, that may be practicable. Liberal applications should be made, usually ten or more good sized loads per acre. If this cannot be done for the entire potato field, it should be done on enough land to supply from two to five times as many bushels of seed potatoes as will be required to plant the next year's crop.

The second requirement for good feeding can be supplied by first preparing the best possible kind of a seed bed, and second thorough cultivation of the crop. In preparing the seed bed, many plow twice, first about 4 inches deep in the fall, and again, 7 or 8 inches deep, in the spring. This method seems worthy of trial. At any rate, the land should be plowed deep, preferably 8 inches. This should be followed by a thorough working up of the seed bed; to be followed by a liberal use of the harrow, weeder and cultivator, as needed during the season.

The benefit to be obtained from the proper feeding and care of the potato crop is greatly increased by the selection of the tubers possessing the most vitality for seed potatoes. Even though the crop as a whole may have been well fed, and the yield large, there is much difference in the way in which certain tubers acquire the vitality that results from liberal feeding.

The sign of vitality in a potato is, most of all, the plump form, as considered with reference to length. Rural New Yorkers and similar varieties should be round and more or less flattened, without the least elongation. Ohios should be as oval, plump, and as short compared with their thickness as they can be found.

The signs of degeneration in potatoes are as follows: (1) elongation of form as compared with the shortest, plumpest form that can be selected for the variety, often accompanied by more or less tapering ends, a taper toward the "seed end" being worst; (2) eyes more numerous than usual, and likely to be deeper than usual, especially in badly degenerated tubers; and (3) an increasing proportion of small potatoes.

The above principles of selection may be applied to any variety of potatoes. Degeneration is the same for nearly all of them. A few varieties do not show the elongation, and the difference in the eyes, that are generally found along with degeneration —until they are almost completely run out. In such cases, the proportion of small potatoes is more important than ordinarily.

Small potatoes should never be used for "seed." They are very likely to be the most degenerate seed stock that could be planted.—A. R. Kohler, Minn. Univ. Farm.

It is now claimed by orange growers that the "adulterated orange ruling" does not apply to California oranges.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

MAKE A STUDY OF YOUR BUSINESS.

Marvelous progress has been made in agriculture during the past ten or twenty years, as exemplified by the leading farmers and stockmen of this country. This progress is the result of two main causes: a better knowledge of the sciences underlying the business, and improved farm machinery. During the past quarter of a century more has been learned about the soil, the needs of plants, the control of injurious insects, plant diseases, and animal diseases than during the century preceding. This is saying a great deal, but it is true. This body of new knowledge has been worked out largely by the experiment staions, in this as well as in foreign countries. Furthermore, the facts discovered by these institutions have become common knowledge of the majority of American farmers through the following agencies: The agricultural college, the agricultural press, farmers' institutes, other farmers' organizations, and short courses. Besides, during the last decade the farmers have been very prosperous and therefore have been in position to put their advanced knowledge of farming into practice.

The other agency that has contributed to agricultural prosperity, improved machinery as mentioned above, has in many respects contributed even more than an education; at any rate, without the improved machinery of today, our present knowledge of farming would not nearly have the value that it does have in connection with the machinery. The productive power of the individual farmer who is up-to-date and who has availed himself of the great body of farm facts that have been accumulating, is undoubtedly twice as great as it was twenty years ago. The question arises what percentage of our farmers are living up to present-day opportunities. How many of them are producing twice as much from a given amount of labor as they did twenty years ago? That all of them are not, is quite evident from the average crop yields as reported by the government.

The amount produced on the farm is not necessarily a true criterion of the success of the farmer; in fact, it seldom is. Some produce more than twice as much with a given amount of man labor as they did a score of years ago, but they are not, barring the increase in the value of their land, making twice as much net profit. While efficient machinery has been invented and come into use, this machinery has cost money. The price of labor has also risen and consequently the cost of production has increased. To secure a large net profit from the farm we must decrease the cost of production. Machinery helps in that direction if it is properly used, but other things must be taken into consideration.

A quarter of a century ago, land that is now greatly reduced in productiveness was rich and fertile. The fertility that has been taken out of our soils and marketed at the elevators, and some of it even at the stock yards, must be returned before maximum yields can be secured. This can be done in one of several ways, but in this section of country practically only through the raising of more live stock and the growing of more legumes, such as clover, alfalfa, peas, etc. Even after this has been done better methods of farming must be practiced. The average man is growing too many weeds, which, like corn and oats, remove fertility from the soil as well as large quantities of water. It is no exaggeration to say that one-fourth of the total amount of plant food taken from many soils in a season and one-fourth of the water pumped out of them is removed by weeds that give no returns whatsoever. The weed problem is a more serious one than the average man realizes. It is one to which he must give especial attention in the future. It is one that will be of very great importance during the coming crop season, because there is a scarcity of water in the soils throughout this territory. In many cases, unless the rainfall should be considerably above normal, water will be the limiting factor in crop production next year.

Think these things over during the winter months. Study your business carefully. Plan your work with a view of going through next season with a smaller supply of water than usual. Do this by putting more work on your land this spring. Disc your corn ground just as early as you can get on it with a team. Do the same with the stubble ground that was not plowed last fall, and also disc the ground that was plowed. Use both disc and harrow sufficiently often to keep a mulch on top of your soil to prevent loss of moisture. Surface cultivation was important last year, but it may become still more important next season; at any rate, make your plans with that end in view.—Farmer and Breeder.

OUR VANISHING DESERT.

A quarter of a century ago, says the Baltimore Sun, any mention of the great American desert called up visions of a region of limitless extent, sun-baked, parched and desolate. A country associated always with tales of suffering and death, of unfriendly savages and deadly reptiles, for years it was passed over by congress as worthless. The marvelous transformation which has been wrought in two decades in this land of silence and sunshine, furnishes one of the most interesting and inspiring pages in the annals of our republic's development.

The great American desert is vanishing from the map. Its boundaries have shrunken and it no longer presents a formidable barrier to the growth and progress of the far west. Twelve million acres of this rainless country have been subdued by means of agriculture and irrigation and are producing bountiful and assured harvests every year. A quarter of a million families are residing on farms, and as many more have found homes and occupations in the cities, towns, and villages which have sprung up in the midst of the agricultural areas.

Great dams have been constructed to impound the floods, and through 70,000 miles of canal and ditches the life-giving water has been turned upon the dusty desert. The streams have been harnessed for power, and an era of manufacturing is dawning in which all of the raw products of the farm, the forests and the mines will be prepared for the markets of the world. The comforts and luxuries heretofore unknown in agricultural regions already are obtainable in many of the western valleys. The farmer lights and heats his home with electricity, and his heavy work is done cheaply by the same potent force. Trolley lines bring the farm and town close together.—Country Gentleman.

GOAT DAIRYING.

The increasing value of land and the advance in the price of milk are making goat dairying increasingly attractive. As the time grows nearer when economy in grazing lands must be practiced, as in Europe, the value of the goat as a milk producer is appreciated. One of the features of the product that appeals to all is its value to young children. The researches of Dr. Barbellion, of Paris, on the digestibility of the different kinds of milk, reported at the International Congress of Medicine, bring out the benefits in a significant manner. His report shows that the curd of cow's milk forms a dense adhering mass, which by agitation separates into clots that are but slightly soluble. On the other hand, the curd of goat's milk forms into very small, light flakes, which are soft, very friable and very soluble, like those in human milk. The curd in both human milk and that of the goat after agitation, is precipitated very slowly and incompletely, while the curd of cow's milk is precipitated very rapidly and very completely. Sumbitted to the action of digestive ferments, human milk and the milk of the goat were digested completely in twenty hours, while the same process applied to cow's milk showed only a very slight advance after sixty hours. Probably the statement which commands greatest interest is that the milk of the goat approximates more nearly in its composition and digestibility to human milk than that of any other animal.

Considering that goat's milk is very palatable, is richer, keeps longer before souring, and the generally accepted statement that it is free from tuberculosis bacilli, the hardy little rival of the cow must soon bid for a wider patronage. "The Case For the Goat," is authority for the analysis of goat's and cow's milk which is as follows:

	Goat's milk	Cow's milk
Water	83.28%	87.56%
Butterfat	7.30%	3.63%
Casein	4.18%	3.75%
Milk sugar	4.10%	5.00%
Ash	1.21%	.75%

The U. S. Bureau of Animal Industry has made repeated attempts to secure a foundation herd of foreign bred goats for experimental purposes, but has failed in every attempt. As far back as 1904 there had developed an interest in milk goats that had increased to almost a public demand for information on goat dairying. George Fayette Thompson of the bureau was assigned the task of selecting a foreign herd, and after looking around decided on a flock from the Island of Malta. He brought a large herd of selected animals, that gave every promise of success, but in a little over a year, the entire importation, including the progeny, was destroyed because of an outbreak of Malta fever, discovered subsequent to their arrival. Mr. Thompson later died of what the attending physicians pronounced pneumonia, but it has been an open question in the minds of his former associates if the real cause of his death was not Malta fever.

Last spring an Illinois breeder desiring to make an importation from Switzerland sought the co-operation of the bureau in the matter. Arrangements were made for one of the experts from the animal husbandry division to accompany him for the purpose of selecting the best individual animals. A veterinarian from the bureau's London branch was to accompany them to examine into the physical condition of the animals selected. A part of the plan called for the quarantining of the importation on an island for a period of six months, to avoid the importation of any diseases that might lurk in their system, as in the case with the importation made by Mr. Thompson. The breeder sold in advance a large number, one customer taking 100. The department thought that this was the chance to secure the long desired herd. All was in readiness for the trip when a cablegram from the U. S. consul in Switzerland advised that there had been an outbreak of the much to be feared foot and mouth disease among the goats in the section of the country the party contemplated visiting. The result was that the whole project fell through, and the quarantine still exists against importing goats from Europe. This explains why there are so few of the imported goats in this country, and why goat dairying has not been exploited more generally over the country.

But now comes a time when land steadily increases in value, and slowly but surely we must learn to follow the thrift practiced on the small farms of foreign countries, where every acre must be turned to account.

Herein lies the value of the milch goat: that she thrives on weeds and brush that other stock ignores; that she yields in proportion to her weight more milk than the cow; and that her milk is richer and more nutritious than that of the former; and is free from the dreaded bacilli of tuberculosis so frequently found where cattle are improperly kept.

Up to the present time probably less than 200 head of Swiss goats have ever been imported into the United States, and these few are scattered widely over this country, so that the sight of a real Toggenburg, Saanen, or Schwartzenburg, as the three best Swiss breeds are known, is of very rare occurrence and their value, as may be imagined, is high.

Of the three breeds mentioned, the Toggenburg is considered the finest, and is to the goat family, what the Jersey cow is to her breed, the aristocrat of the race. In color they vary from light to a dark brown on the body, with white bars down each side of the face, and white from the knees and hocks down. The coat also varies in length, some having short and others long coats, but the hair in either case is thick and fine, and the race markings very distinct. The heads of these goats are finely shaped, and their long, delicate ears give them much the appearance of deer. They are most attractive creatures and quite superior to the ordinary goat in every respect. The Toggenburg is hornless though occasionally a kid is born with horns.

The Toggenburgs, when properly handled, yield from three to five quarts of milk per day, and should give as much as two quarts eight or ten months after kidding. One doe gave at her second kidding 248 pounds and six ounces of milk in 28 days, and three two-year-olds raised in California from imported parents at their first kidding gave as follows: Gretchen, a triplet gave six pounds, five and one-half ounces per day. Katrina, a twin, gave seven pounds and four ounces; Griselda, a single kid, gave seven pounds and eight ounces.

When writing to CULTIVATOR advertisers ***BE SURE*** to say where you saw their advertisement. It will cost you nothing and *MAY* do you some good.

These records were made a month after kidding.

In comparing these high grade goats with ordinary stock, there is noticed the greatest difference in the size, quality and duration of the yield, fineness in texture of udder, and intelligence and gentleness of disposition, in each instance the Swiss excelling the native.

One of the most successful breeders of Toggenburg goats in this country is the firm of Howland & Hurd, of Redlands, California. They have produced a milker in their thoroughbred, "Fanette," whose record has not been excelled in this country or Europe. She kidded on February 8, 1909—buck and doe kids. On the 14th her milk record was started and the product weighed twice daily. On January 29th of this year the milking was ceased and the record showed 1708 pounds and 13 ounces. Her greatest record for one day was Aprlil 7, 1909, when she yielded 9 pounds and 10 ounces, or approximately 5 quarts of 7 per cent butterfat milk. She weighs 135 pounds.

At present there is no regularly established price for goat's milk as the supply never meets the demand in towns or cities, where it can be procured. When certified it sells for as much as 50 cents a quart, 25 cents for pints and 15 cents for half pints. What has been done along the line of goat dairying has been accomplished in the hands of individuals. The department of agriculture has never been able to determine the limits of goat dairying, or to even exploit it to any extent. At the present time the bureau of animal industry is carrying on a series of milk experiments at the new breeding farm, to obtain certain information with regard to the milk of the native goat, such as are raised in Georgia and Alabama.

That there is an unexploited field in this country for goat dairying, cannot be denied. That a market awaits goat's milk, when properly handled, at a price that admits of profit, is likewise true. The industry is practically in its infancy, but the feature which will appeal to those who depend on the goat to supply food for the infant, or young child, is the fact that when the family goes away on its summer or winter trip, the milk supply can go also. Nanny can be put in a crate in the express car and "Snookums" will not miss a meal and there will be no fear of the long train ills that follow in the wake of a change of milk for the baby.—James E. Downing, in Hoard's Dairyman.

PREPARING HOG CHOLERA VACCINE.

As every farmer well knows, certain hogs are naturally immune; i. e., resistant to hog cholera infection. When such hogs pass through an outbreak, receiving infection from which they recover, they become, as a rule, permanently and for all practical purposes absolutely immune. One of these exposure-immune hogs may occasionally be made, under certain abnormal conditions, to take cholera.

It has been proved that when such immune hogs are treated with large doses of virulent blood from sick hogs, it does not kill them, although very small doses of the same blood may kill susceptible hogs in a few days. The immune hogs, treated by large doses of this virus, develop in their own blood something which has the power of protecting ordinary susceptible hogs from infection. The immune hog, after receiving the large doses of virulent (disease-producing) blood, becomes what we call a hyperimmune, i. e., a very highly immunized hog, and will hereafter be referred to as the "hyper" or the "hyperimmune." The ordinary immune hog may be converted into a hyperimmune by either one of the several different methods. He may be treated either by inoculation under the skin with very large doses of blood from sick hogs, or by inoculation with much smaller doses directly into a vein, or by injection of the virus directly into the abdominal cavity. We now prefer the vein injection method, because it requires only about one-half as much virus blood, and is quicker and perhaps more certain of producing fully potent serum.

When blood from such specially treated immune hogs, i. e., from the hyperimmune, is injected into the bodies of susceptible hogs, they in turn become immune for a time. During this short period of immunity we can expose such vaccinated hogs to cholera in the pen, or give them injections under the skin of very small doses of virulent blood. In either case we have given susceptible hogs, first, a treatment which enables them to resist the disease; and, second, we have given them the disease, from which they recover and become perfectly immune.—Minnesota University Farm Press.

Wash and oil the collars occasionally. Two minutes' work at the end of the day is sufficient to keep the surface of a collar clean, soft and pliable. A damp sponge and a cake of harness soap kept in the curry-comb box are the only equipment needed. Shoulder galls are due to one of two things: dirty, or ill-fitting collars. There is no excuse for either.

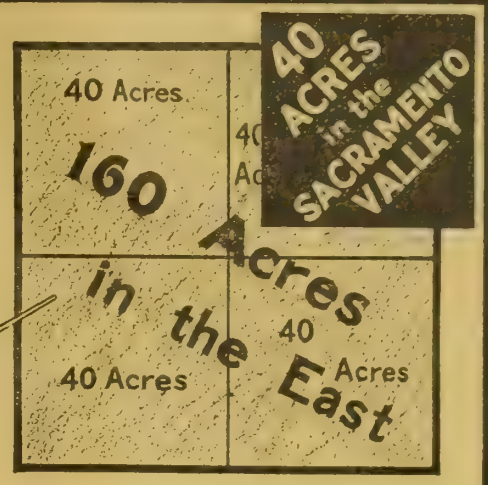
Barley and corn should be fed only in small amounts. Most of the severe cases of colic come from the improper use of these two feeds.

I CAN

Raise more FEED on 40 acres in the Sacramento Valley near Willows than I could raise on 160 acres on my Eastern Farm.

—Statement of a Wisconsin breeder of registered Holsteins who owns one of our SMALL FARMS.

His name given on application.



In other words—

One of our 40-acre small farms will produce 4 TIMES as much feed as 40 acres in the Eastern dairy States.

This would be the size of your haystack in the East and in the Sacramento Valley

When you raise four times as much feed on a given number of acres it also means that you can feed four times as many cows.

On one of our Sacramento Valley irrigated farms you don't have the snow and blizzards of winter to contend with—you don't have to store away fodder for winter feeding—you don't have to sit back and wait for spring. Your cows, pigs or chickens can run out in the open.

We have an abundant supply of water at all times during the irrigating season.

Just see what a small amount it takes to be a "California Farmer" on one of our small farms.

$15 DOWN THAT'S ALL $11 A YEAR THAT'S EASY

Climate, soil and water are your helpers. You can purchase your cows on the installment plan, paying for them with half the amount of your cream checks. All that is needed is your guidance and your willingness to work. If you sow, you will reap. Every day in the year the alfalfa is growing in the field. Five to seven crops a year is general—many cut seven and eight, and harvest from one to two tons an acre each cutting.

Alfalfa hay in the stack sells readily at from $5 to $7 the ton, and if held and baled it should yield from $10 to $18 the ton.

The most profitable returns to be realized, however, is to feed it to your stock. One acre of alfalfa will support one cow, two hogs and a calf. Each cow should produce on an average $75 to $100 worth of butter fat in a year. The calf should be worth from $7 to $10 at the end of the year, and the two hogs should weigh from 200 to 250 pounds, giving an income for the year of from $90 to $130 per acre.

One of the attractive features of dairying on this plan is that the revenue is coming in every month of the year. This estimate can be very materially increased by raising a flock of poultry.

The man who investigates the actual facts regarding this country—who interviews those who are here now realizes that

"TWENTY'S PLENTY—FORTY'S A FORTUNE"

Twenty acres is plenty; it will give you a freedom and independence experienced only on a Sacramento Valley small farm.

If you are now farming in a country where the snow falls, or if you are tied to some desk or city job, you are on the wrong road to find absolute happiness.

Personal freedom, with its pleasures, profits and plenty, is found only in the great open-air country of California. If you want to be healthy, happy and hearty, with more than an even break to become wealthy, write for detailed information regarding these small farms.

You can purchase from 20 to 80 acres in this fertile district for $125 an acre, $15 down and the balance spread over ten years. Expert dairymen and agriculturists will advise you free of cost, and every co-operation will be extended. If you'll work, you win. Do you want to be king of a little kingdom, all yours?

Then write to us today for maps and printed matter.

NET WEIGHT.

A step in advance has been taken by the Southern California Walnut Growers Association in a resolution to give net weight in the marketing of walnuts. Heretofore a sack weighing some two or three pounds to each hundred has been weighed in as a part of each shipment. The sack, costing a merely nominal sum, was thus used to bring the grower 15, 16 or 17 cents weighed out as walnuts. The sum gained was too small to amount to much, and yet both wholesaler and retailer were somewhat restive under the practice. The pure food laws and general trade practices are working towards the honest weight package. The farmer often has a just grouch because of mistreatment received along this line, but his complaint comes to the wholesaler with poor grace while he does the same thing to the limit of his opportunity. From this standpoint the walnut men have argued that one way to secure honest treatment is to give honest treatment. This is along the line of Mr. De Motte's article in last week's paper. It is one of his ideas that standardization of fruit is merely putting common business honesty into the package. We believe the walnut growers' determination is a wise one and that it will enable them to demand absolutely just treatment. The argument is entirely on policy or business grounds; morals have nothing to do with it.

ON TRIAL.

The State Board of Game and Fish Commissioners has secured the expert aid of Prof. H. C. Bryant of the state university to investigate as to the effect of the meadow lark, robin and blackbird upon the growing crops and upon grapes and other fruits. In other words, these three birds are on trial for their lives. Certain producing sections have maintained for some time that the meadow lark is a culprit and must be removed from the California landscape. The indignation expressed all over the state at this effort resulted in the last two state legislatures refusing to lift the protection from these sweet songsters. The birds have some arguments on their side; admitting that they do some injury, their beneficial work on predatory insects is of sufficient value to overcome the loss they cause. It will take months and perhaps years to complete an investigation along this line. It can readily be proved that the birds eat some grain and some fruit and it can as readily be proved that they eat many destructive insects. Whether it is possible for any scientist to strike a just balance we question.

ENGLISH CO-OPERATIVE BUYING.

The English farmer is far in advance of the American in the matter of co-operative purchasing organizations; in the matter of selling organizations the American is in the lead. There is no marketing organization in the world equal in scope and in success to the California Fruit Growers Exchange. The Co-operative Agricultural Trade Society incorporated under what is called the Industrial and Provident Societies Act is saving great sums to the purchasers of fertilizers, feed stuffs and farm implements. The society after purchasing its fertilizers has them analyzed for each individual if desired and consignment is made directly to the user. When a sufficient number of farmers decide that they wish to form a co-operative trade society they write to the secretary of the central organization and are given full privileges. In a statement recently made by the concern it is asserted that while co-operation is not a cure-all or a panacea it comes nearer than other methods tried to lighten the burdens of the English farmer. It is especially advantageous to the small farmer.

CALIFORNIA'S POSSIBILITIES AS A SUGAR PRODUCER.

California produces the highest percentage of sugar in her beets of any section of the world, and while there are other states with a greater number of factories this state will soon surpass all others in tonnage. But reference to the excellent article by Mr. R. L. Adams on another page of this issue will show that in tonnage per acre we have a valuable lesson to learn. Mr. Adams says that the sugar beet is an exacting plant to grow and that only good farmers make a success with it, yet the profits are worth securing. At 10.60 tons to the acre, which is California's average, our farmers are averaging only about the cost of production, that is, including the farmers' work. The table given shows that both Utah and Colorado surpass us and the average of the United States is practically that of California. These figures should spur us to more intensive culture. Mr. Adams' article is a most excellent one and will be followed by others helpful to the grower and those about to become growers.

Nothing on earth is too good for the farmer boy and girl. Why should young, inexperienced teachers be permitted to experiment upon your children? Why should the idea prevail that a teacher must "make good" in the country before he or she can be entrusted with the children of the cities? If they are to fail, why prove the inefficiency to the detriment of the clearest brains, the best-working capacities, the greatest possibilities of the thinking world? Why? Because too many farmers have given too little attention to this phase of life.—Mrs. C. W. Boucher, Marion Normal College, at Farmers National Congress.

California canned tomatoes are superior to any packed in the United States, the superiority lying principally in the color, which is so typical that Eastern consumers have made the claim that California canned tomatoes were artificially colored. Tomato canning is one of the great industries. Last year's output is already cleaned up and out of the market.

If the farmer will make more of recreation and social life, encouraging in every way the development of both, he will find less desire on the part of his young people to drift away to the cities. Of course, schools, good roads, rural mail delivery, telephones, good churches and many other factors increase the attractiveness of the farm, but social and recreation conditions may be more quickly changed for the better.

A writer in the Kansas Farmer says: Last fall I smeared some trees with axle grease to keep the rabbits from peeling them, and this spring I found I had killed all the small trees. The bark was dead and black just as far as the grease went, although the tops started to grow.

Ventura County's horticultural commissioner is making careful experiments with the Wiley walnut blight spray.

The state of Washington has 47,110 farmers as compared with 28,020 in 1900. Nearly 8000 farms are conducted by tenants. Twenty per cent of the farms are reported as mortgaged.

The Department of Agriculture has issued through the Bureau of Biological Survey Circular No. 78, "Seed Eating Mamals in Relation to Reforestation." It touches upon ground squirrels and other pests which destroy forest trees and gives methods of eradication and control.

Bulletin No. 208, on Late Blight of Celery, by Stanley S. Rogers, has a great fund of information for celery people. In addition to a very complete text, illustrations of growth and culture add to the value of the bulletin. It should be in the hands of every grower, and may be had by writing to College of Agriculture Experiment Station, Berkeley, Cal.

The University of California is making a special effort to advertise its summer school so as to induce teachers from various parts of the East to spend the summer in Berkeley and be present during the convention of the National Educational Association which will meet in San Francisco, July 8 to 14. Booklets are being sent out referring to California's advantages as well as the advantages of the midsummer school.

The office of Experiment Stations has looked into the matter of attendance at agricultural fairs and finds that the attendance at the 1203 county fair associations in existence during 1909 was 6,103,227, and the gate receipts, income from concessions, and appropriations aggregated $2,525,750,05. Much information regarding the fair associations and their needs is given in Experiment Station Circular 109.

The Department of Agriculture has departed from its usual line in issuing in Bulletin 432 "How a City Family Managed a Farm." It gives description of the old run-down farm, amount of capital and other resources, plans of arrangement of the fields, cropping system, buildings, labor, system of employment, and even family discipline and household problems enter into the report. We do not know that it would make a good working plan for any other farm, but there are suggestions in it which make it worth writing for.

It is unfortunate that the Walnut Growers Association fails to market its product so as to secure best returns. The association is organized on such a loose basis that it can hardly be said to be working under a "gentlemen's agreement." In fact, there is not much agreement to it, and this because one or two of the larger associations refuse to pool their nuts with their neighboring associations. This is especially to be regretted when it is considered that the quality of the nuts is practically the same in all sections and only ordinary care in grading will assure uniformity of output. As it now stands each association may market as it pleases, when it pleases and where it pleases, and in addition while it makes no fixed and unchangeable price there is a general understanding which permits the outsider to take advantage of the association price. This attitude of the walnut men in the face of the remarkable success of the citrus growers exchange is not understandable.

Agricultural News Notes of the Pacific Coast

Northern California

Eastern capital is investing in large tracts of land near Chico, Butte County.

A rose carnival is to be held in Santa Rosa, Sonoma County, on May 4, 5 and 6.

A Grange of the Patrons of Husbandry has been organized in the Gold Ridge section.

The foothill sections of Placer and Eldorado Counties are planting extensively of Bartlett pears.

Mr. C. C. Moore, of San Francisco, has been chosen as president of the Panama-Pacific Exposition.

The forest service is making extensive plantings of forest seeds in the Trinity National Forest.

The first shipment of strawberries into Secramento was on April 13, from Penryn, Placer County.

Maxwell, Colusa County, is pleased at the number of colonists who are purchasing lands in that section.

It is claimed the poultry industry at Dixon, Solano County, has increased 75 per cent in the past few years.

Woodland Mail reports half to two-thirds of the fruit crop of the Capay Valley as destroyed by the early April frosts.

A large dairy ranch at Oroville is being improved by the building of large barns, each of which will house 100 dairy cows.

More conservative estimates of frost damage in the wine grape districts is that 25 per cent of the crop has been lost.

A new $2,500,000 corporation is planning to develop water for irrigation of lands in Sacramento, Eldorado and Calaveras Counties.

The next meeting of the Counties Committee of the California Development Board will be at Eureka, Humboldt county, June 2nd.

Sutter county peach growers report predominance of "double peaches" which will necessitate much thinning in order to secure fine fruit.

Sacramento capitalists are experimenting in poultry culture and will put an expert in charge of a large plant at Robla, Tulare County.

Some vineyardists near Lodi are contracting for the coming crop of table grapes at $25 per ton August delivery, $18 per ton subsequent.

One firm in Yolo County is contracting for hops on a three-year basis at 15 cents per pound for the 1911 crop, 14 cents for the '12 crop and 13 cents for the '13 crop.

The annual farmers picnic will be held at the State University Farm at Davis on Saturday of this week. Addresses will be made by President Wheeler and Professor Wickson.

Fifty-four thousand acres of land will be subdivided and disposed of in small parcels in Sutter County. The town in the center of the tract will be called Rio Oso. It is the property of the Natomas Consolidated.

Horticultural Commissioner Hecke of Yolo county, reports that owing to apricots being short in quantity of blossom, also because of the early April frosts, the almond crop will not exceed 30 per cent of normal; the apricot crop will be about 25 per cent.

Central California

Last Saturday was clean-up day for Kerman, Fresno County.

Fishermen are happy over a fine run of salmon in the San Benito River.

A timber company is planting sixty acres to eucalyptus near Delano, Kern County.

Thirteen thousand five hundred citrus trees will be planted near Delano, Kern County.

The Kerman Alfalfa Company has just received a shipment of ninety pure-bred Holsteins.

Porterville, Tulare County, reports the shipment of a $50,000 bunch of fat cattle on one day last week.

A sheepshearer at Porterville, Tulare County, is affected by a disease very closely related to "anthrax."

The size of the coming prune crop is yet a problem with the general guess running "at least a fair crop."

As result of some little friction in the Tulare Irrigation District the former secretary has tendered his resignation.

The overflow of the Spreckels canal at Salinas, Monterey County, filled wells drilled for irrigation purposes at Fort Romie.

Prunedale, Monterey County, reports a magnificent crop of hay and grain, the late showers coming just in time to perfect the crop.

Rangers of the Sequoia and Sierra National Forests recently met at Trimmer, Fresno County, and discussed methods of fire protection.

Orange growers of Tulare County think the possible frost injury to deciduous fruits may bring a larger price for next year's orange output.

Northern Tulare County is coming to its own as a producer of citrus fruits; this section was not developed along this line until about two years ago.

Sportsmen are complaining because there are no fish in Kings River this year; the complaint is that the weirs prevent the fish from coming up from the lake.

As an evidence of good faith and to show that they can do it, some ranchers near Salinas, Monterey County, are growing oranges on the low bottom lands.

The setting of highway trees in Tulare County is under the control of a county forestry board and property owners are forbidden planting without permit.

The last demonstration train trip of the Southern Pacific and State University ended last Saturday afternoon, the last place visited being Walnut Creek, the trip having been made up the coast counties from Hollister.

A writer in the Fresno Republican is urging the raisin growers to "nail the six-cent flag to the mast." The frosts have reduced the promise of the coming crop so that raisin growers are firm in their holding of the holdover.

Apricot growers of Santa Clara Valley believe the dried fruit market will be such that good dried fruit will command 15 cents this fall. The San Jose Times states that 12½ cents has been offered already and that some claims of sales have been made at 14.

Southern California

Lima bean people of Ventura County are busy with planting.

San Diego was the Mecca of rose lovers at its rose show last week.

An alfalfa meal mill is being constructed at Corona, Riverside County.

Corona, Riverside County, is installing machinery for an alfalfa meal mill.

Beaumont alfalfa growers will produce more alfalfa seed than heretofore.

Farmers at Brawley, Imperial County, are making plantings of seedling dates.

Los Angeles supply of asparagus is now being received from San Joaquin River points.

El Toro, Orange County, reports apricots well advanced, with a large crop in prospect.

San Fernando alfalfa growers are the latest to join the co-operative marketing movement.

A Riverside fruit grower has just returned from an investigation of avocado growing in Mexico.

The beet fields near Huntington Beach, Orange County, are reported in the very best of condition.

Escondido, San Diego County, estimates its output of lemons for this year at about eighty-five cars.

Viticulturist Husmann is setting two and one-half acres of grape cuttings of 210 varieties near Brawley, Imperial County.

Borings to bed rock are being made by the engineering force of the Los Angeles aqueduct system on the great dam site near San Fernando.

The bee inspector of Imperial County is serving notice that colonies of bees must not be brought into that county without securing permission.

Redlands maintains a municipal nursery in which trees for street and park planting are produced. Five thousand trees are now ready for distribution.

Walnut growers will not give definite information as to prices that will be placed on the coming crop, but the feeling is that last year's price will be reached.

The Pala Indians are fencing and otherwise improving lands recently allotted to them. The Indian office feels much gratification at the spirit shown by the Indians.

The litigation over the flooding of Salton Sink, which resulted in the destruction of the salt works, has been transferred from Imperial to Los Angeles County courts.

The spreading of the waters of the Santa Ana in the gravel beds above San Bernardino is causing contention between that town and irrigating sections below which are benefited.

A canning company which planted 700 acres of valuable pea seed near Brawley, Imperial County, has failed because of improper preparation of the ground and lack of experience of men in charge.

The Park Commission of San Diego is surrounding the seed of cocos plumosa palms with wire gauze to save them from dropping and being carried away by visitors. The seed from a single palm is sometimes worth $5 or more.

The Coast

Wasco County, Oregon, shows "Crops backward. Need rain."

Washington grain growers are appealing for another soaking rain.

Over 1,000 men are at work on the Yuma project of the reclamation service.

Very heavy frosts visited nearly all sections of Oregon on the nights of April 12 and 13.

Albany, Oregon, reports that Linn County's fall grain crop is looking exceptionally well.

The reclamation service has purchased 600 acres to add to a reservoir site in the Boise project.

Fifty per cent of the peach blossoms of Yakima County, Washington, are reported in condition to set fruit.

A contract for furnishing electric power for pumping to irrigate 2,000 acres near Phoenix has been closed.

Forest reserves in Coeur d' Alene and Clearwater sections near Wallace, Idaho, are being protected from fire depredations.

The poultry association of Elmira, Washington, has formed a boy's annex for the purpose of educating the youngsters in poultry handling.

The Byron Jackson Pump Works has been awarded the contract for six monster centrifugal pumps for the Salt River irrigation project in Arizona.

Careful examination of orchards near Walla Walla, Washington, shows at least average crops of apricots, peaches and apples, but early cherries seriously injured.

Sheepshearing has been finished at Walla Walla, Washington. The flocks have dwindled from 200,000 sheep a few years ago until now there are less than 20,000. This is owing to forest reserve policies and the extension of fruit growing.

The Northwestern Live Stock Association is planning a great show of the live stock of the Inland Empire of Eastern Washington and Northern Idaho to be held at Lewiston next December 12-14.

The Santa Fe Railroad and capitalists have purchased a great tract of land near Prescott, Arizona, and a reclamation scheme will be inaugurated which it is estimated will cost about a million and a quarter.

The fruit growers of the Inland Empire, Eastern Washington, find that as the warmer weather restores the trees to vigorous growth the frost injury of the second week of April is not so serious as at first anticipated. However, some sections still show a total loss.

The schools of Salem, Oregon, have installed Babcock milk testers, and it is obligatory on the part of all pupils to learn to test milk. The idea is that the youngsters will grow up and be able to test their own milk if farmers, or their own purchases if living in town.

A poultryman at Medford, Oregon, claims the largest record in thirty-five pullets which laid 913 eggs in thirty-one days. Eugene, Oregon, goes one better, claiming 809 eggs from twenty-four Black Minorcas. These latter eggs averaged twenty-eight ounces to the dozen.

WHY COULSON'S IS THE BEST POULTRY FOOD YOU CAN BUY

REASON NO. 1. Because it is composed of clean, sweet and wholesome grain.

REASON NO. 2. Because it contains, in addition to grain, beef scraps, blood meal and other ingredients in the necessary variety which is essential to healthy and vigorous fowls.

REASON NO. 3. Because it is thoroughly mixed, so that every measure contains its relative proportion of the component parts.

REASON NO. 4. Because it is free from dust, dirt and other impurities. The bottom of the sack is the same as the top.

REASON NO. 5. Because we buy in large quantities, secure low prices and give you the benefit.

REASON NO. 6. Because our food is the result of careful study and practical test.

REASON NO. 7. Because thousands of successful poultry raisers use our food exclusively. They have tried it and know its value.

Practical Poultry Culture

DARK CORNISH, AS BRED TODAY.

Charles S. Brent, Vice-President of American Cornish Club.

The Cornish are not a new breed, but a tried and true breed, originated in England in 1840. They have stood the test of time, and have not been found wanting in that which is required to make up the utility value as well as value from a fancier's view. It is not an idle boast when we Cornish breeders claim that there is nothing in chickendom that equals the Cornish fowl for the table. Why? The origin of the variety will show that meat and bone were the essential point desired. First a Red Aseel was brought to England from India. This bird, short, heavy, great width of body, compared to other fowls like the French Percheron horse to the roadster. The Red Aseel was crossed with the Lord Derby English Game, and the Malay, and in the early 70's a cross was introduced of what Lewis Wright calls "Pheasant Malay." The flavor of meat of a young Cornish bird or a Cornish capon can well be termed a "pheasant flavor." In England the Cornish have been the favorite table bird for over half a century. The qualifications required for a table fowl are that they should be quick growers, dress well for the market, be attractive and clean in appearance when dressed. These qualities the Cornish possess in a remarkable degree. The fancy market in large cities demands a plump, yellow-skinned fowl for the table. Where do you find the healthy richness, the something that looks good to eat, more than you would in a clean, dressed Cornish with its plump, yellow body, yellow legs and healthy appearance? Neatness, cleanliness and healthy color and apearance in a fowl dressed for the table, with a plump round body, are the popular table requirements. I claim that no fowl ever grown can come as near having these as the Cornish. We do not claim the laying qualities of the Leghorn or Minorca, and other smaller breeds, but I believe Cornish can be brought to a splendid laying value by a system of trap-nesting. Many of the more enterprising Cornish breeders are beginning to realize the value of selecting their best laying females, and continuing their progeny, discarding the non-laying females, and in this way build up a much improved laying flock. The trap nest, or some system to know your best layers, must be resorted to, so that the Cornish fancier will use only his very best layers for reproduction. We do not expect to produce Cornish females weighing from eight to ten pounds each that will equal the little Leghorn in laying, with her four to five pounds weight, but we do expect the Cornish fowl to excel in laying qualities over many of the larger varieties. For so large a fowl, the Cornish are not lazy, they are very acitve, and if properly cared for can be bred to a high standard of value as a laying fowl. From a fancier's view, the Cornish are the aristocrats of the show room. Many of the finest specimens bred in England have been shipped to our fanciers here in the past three years, and prices are always high, thus you can see the advantages of taking up the Cornish as a "fancier's fowl," as well as for various reasons. The state of California, with its loyal fanciers, perhaps leads all the other sections in appreciating the good points of Cornish fowls. Many hundreds of dollars are invested in Cornish by fanciers in California, and the importations of a few breeders in the Middle West and their great winnings with these birds at the leading shows both East and West demonstrate the superior exhibition qualities of these English-bred birds over the kind that were being bred here in the states up to the time of these importations. Some few, perhaps not more than two, "would-be" lovers of Cornish made a great fuss over changing the name to "Cornish" instead of "Cornish Indian Game" or "Indian Game." I am sure, could anyone who might know the wisdom of this change, in that the variety has increased in popular favor many fold, they would not be so ready to find fault.

A beginner might ask, "Why do we get the best Cornish from England?" This is partly answered in the climatic conditions. Over in England, hatching starts in January and February. The long season ahead for the chicks is of just the right temperature to produce great size. We may overcome this, to a certain extent, by hatching in April and May, growing our birds quickly, and, above all, having plenty of shade and good, clean water three or four times a day. Proper food rations and cleanliness are absolutely necessary. Discard the narrow-bodied kind for current type. In width of body "bulkiness" is the present trade mark.

STATE FEDERATION OF POULTRY CLUBS.

Fifty poultrymen recently gathered at San Jose and formed the State Federation of Poultry Clubs. Thirteen counties were represented. Los Angeles, Alameda and Santa Clara Counties had the largest number of delegates. Petaluma was not on the list, but this was owing to a misunderstanding of the purposes of the organization and it is expected that Sonoma County will be heard from at the next meeting.

The call was sent out by the Santa Clara County Association for the purpose of having an exhibit of the poultry industry of California at the Panama-Pacific exposition in 1915 that shall surpass anything that has ever been shown before. It is intended to have a conference with the managers of the fair at an early date and have the poultry exhibit placed in their hands.

The officers shall be a president, a first and a second vice president, a third vice president, a secretary, and treasurer. That the governing power of this federation be vested in the officers above named and an executive committee consisting of one member from each of the various poultry associations which may be represented at this meeting and such other associations as may apply for membership in this federation.

The following officers were elected: President, W. E. Gibson of Oakland; first vice president, Samuel B. McLenegan; second vice president, J. L. Harrison of Pasadena; third vice president, G. W. Smith of Fresno; secretary, Joseph T. Brooks of San Jose; treasurer, W. S. Macy of Santa Barbara.

These officers will serve temporarily until July 22, when permanent organization of the federation will be effected at Santa Cruz, where the federation will hold its next session during the poultry show. The annual meeting will be held at Los Angeles during the poultry show there.

INDIANA EGGS ARE BAD.

The farms of Indiana produced over 72,000,000 dozen eggs, valued at over $12,000,000, in 1910. A large proportion of these eggs were not first-class in quality, many of them being small, dirty, washed, cracked, stale or rotten. The following figures, taken from Circular No. 140 of the U. S. Department of Agriculture, are given to show the per cent of undesirable eggs that are sold upon the market in the middle western states: Dirties, 2 per cent; broken, 2 per cent; chick development, 5 per cent; shrunken or held, 5 per cent; rotten 2½ per cent; mouldy, ½ per cent; total, 17 per cent.

Observation of conditions in Indiana has not shown that the eggs of that state are any better than any other; in fact, some reports seem to indicate that the reverse is true. Assuming that the above figures are applicable to Indiana, it is fair to state that the annual loss to farmers selling good eggs amounts to over $2,210,000. This amount might therefore be saved to the producer without extra cost to the consumer, if buyers would buy eggs on their merits.

Feed the pullets ground bone or bone meal. This will supply mineral matter, which is much needed before they begin to lay.

GET ACQUAINTED WITH YOUR FLOCK.

It certainly pays to take pains to get acquainted with your fowls. Hens that are frightened almost to death every time an attendant goes among them cannot do well in egg production. Fright has a detrimental effect on the egg basket, just as it has on the flow of the milk of a cow. This is a well-known fact. You have seen young flocks that were in a panic every time a human being came into their quarters. Something is wrong when such conditions exist. Fright is usually the result of children's work. If children are allowed to get into the coops and chase the chickens just for sport, you needn't expect any eggs, especially not in winter. Train your hens so you can sit down among them and have them pick dainties from your hand. You cannot hope to get every bird as tame as that, but you can train all of them so they will never fly or run off in a panic when people appear among them.

To tame a wild flock, proceed as follows: Get some bread, bits of meat or even shelled corn, and with it sit down on a box in their midst. Make no violent motions, but very slowly toss out small pieces where the more venturesome can reach them. Take plenty of time and exercise considerable patience. In a little while they will venture nearer and nearer to the food. Do not try to touch any of them while giving the first few lessons. After they have learned to know you and begin to eat from your hand, there is plenty of time to make more intimate advances. It is unwise to go into the coops during the daytime to chase and frighten fowls in an effort to catch some of them. Take them from the roost at night if possible. Better still, coax those you want into an outer enclosure to catch them. A stray dog or cat or pig getting into the poultry house will often throw the hens into such a panic that they remain in a state of nervous excitement for hours.—Farmer and Breeder.

The Imperial County Bee Keepers Association has been reorganized and is now on a co-operative basis. The acting directors are: G. W. Nichols, B. F. King, Thomas Phillips, J. W. Whittaker and J. H. Huff, all of the El Centro and Silsbee country.

Test irrigation wells are being bored near Yuma, Arizona, one well now being over 700 feet deep.

This open front door makes perfect ventilation

Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs.* Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

NEW OUTDOOR BROODER
Heated—Storm-proof

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

Irrigation and Forestry

ELECTRICITY ON THE FARM.

By M. A. Johnston, M. B.

The poet and novelist have given us alluring pen pictures of the old-fashioned plowboy and dairymaid, but the lives of these products of a primitive civilization are not so attractive at close quarters. How much better it is to turn on a bright electric light simply by pushing a button than to trim and light an oil lamp at the risk of starting a fire! Certainly it is more sanitary to clean the horses and cattle with an electric vacuum apparatus than to scatter the dust and dirt with a currycomb or wash it off with a hose. And it is admittedly quicker and more effective to milk the cows with a vacuum milker, or to clip the horses and shear the sheep by motor-driven devices, than by hand.

The introduction of the tungsten lamp, which gives three times the light for the same current as the carbon-filament incandescent lamp, has placed electric lighting within the reach of every fairly prosperous farmer in the country. And from electric light to electric power service is but a logical step. The rural mail delivery, the telephone and the automobile have brought the farmer into closer touch with civilization, and it is but natural that he should want the benefits of electricity, which in many ways he can use to far greater advantage than the ordinary householder in the city or town.

If an electric power service is possible on a farm, it will go a long way toward solving the problem of the hired man, for the ubiquitous electric motor can be made to do almost any kind of labor. All the smaller machinery can be electrically driven, either by individual motors or by a portable motor outfit. Electrically operated pumps will render the farmer independent of the weather by filling the irrigation ditches or directly spraying the fields or greenhouses. And even plowing by electricity is not only feasible, but nearly 20 per cent cheaper than plowing by horses, and about 38 per cent cheaper than steam plowing, as proved by statistics recently compiled by a German authority.

There are several methods by which the farmer can obtain his electricity. If close enough to the power lines of a central station company he can usually buy his current to advantage, and often at a cheaper rate than the city dwellers. The big power companies of the West, who cater especially to the farmer, maintain substations from which the current is supplied at a voltage of from 2200 to 13,000 (usually 6600) volts to secondary distributing systems. At the farms there are small transformers which convert this high-tension current to a lower voltage, usually 110, for operating the motors and lamps.

If the farmer is too far away from a power line to buy his current profitably, he can generate it himself. Thus he may harness a small waterfall, erect a wind motor, or use a steam, gas or oil engine.

The water turbine is practical and costs nothing for its "white coal," which is plain, ordinary water, otherwise running to waste. It is to be recommended when the water power is available.

"Overshot" waterwheels, in which the water enters the buckets from the top of the wheel, are suitable for falls of from 12 to 20 feet. The peripheral velocity of the wheel will vary from 3 to 6 feet per second, in small wheels, to 10 feet per second in the larger sizes. The buckets or floats should be well ventilated if a high efficiency is desired, a feature of importance in practically all types of water motors.

"Breast" waterwheels, in which the water enters about the middle of the wheel, are suitable for smaller falls than the overshot wheel.

"Undershot" waterwheels, in which the water enters the buckets nearly at the bottom of the wheel, are best for the lowest falls, of from 1 to 3 or 4 feet.

For falls above 20 feet in height, there is probably no wheel to compare in both cheapness and efficiency to the Pelton wheel, which depends entirely on the impulse of water on the buckets, and not upon gravitational action of the water in flowing from a high to a low level.

In all cases, the services of a consulting hydraulic engineer should be requested before deciding on the type of wheel to employ. The simple waterwheels may even be made by the farmer himself.

The wind motor or windmill is not as a rule favorably regarded in this country for generating electricity, although quite a large number of successful wind-operated plants are operating all over the world. Perhaps the best installation in this country is an imported English plant on an estate in Long Island.

The question of fuel and attendance limits the field of the steam or gas engine, although where natural gas is found, or where a gas producer is feasible, the gas engine may be successfully applied for generating current on the farm.

For small farms, the gasoline or oil engine is perhaps the most practical and economical. It may be used directly or in conjunction with a storage battery.

The electric automobile or wagon is a useful adjunct about a farm, and where horses are not regularly used for other purposes, electric vehicles will be found profitable, convenient and speedy. For loading farm products in the field and conveying them to the barn or to market, the electric truck will often be found cheaper than the horse-drawn wagon, and its great capacity and speed in running will greatly economize the time of the drivers. In fact, Germany has gone even a step further in this direction, for in that country there is a farm which has a narrow-gauge electric railway for transportation purposes, and its results are said to be highly satisfactory.

The importance of the problem of irrigation must not be overlooked in a review of this nature, as it is closely associated with the development of electricity on the farm. It is generally admitted that the addition of a hydroelectric plant to an irrigation project adds materially to the value of the undertaking and to the return on the investment as a whole. Electric motors are ideal for pumping water from low-lying irrigation ditches, and, in California, many orange groves and plantations on hillsides are made possible by electric pumping. It has been estimated that an acre of land can be covered with water to a depth of a foot by the expenditure of 2 kw.-hours of current for each foot of lift of the water. The average cost for this power is 10 cents.

With regard to the financial considerations involved, it may be mentioned that the U. S. government irrigation projects cost approximately $30 per acre of land reclaimed. The value of the irrigated land is on an average about $100 a acre. An alfalfa ranch in the state of Washington cost $600 a few years ago when the land was principally covered with sagebrush. When irrigated, it was sold for $3000, and, after $1500 had been put into it in improvements, chiefly electrical, the owner refused an offer of $7800 for the property.

When this country begins to abandon extensive for intensive farming—that is, when the farms are made to produce their maximum output—electricity will not only be advisable, but indispensable. Then, perhaps, the crop output will be forced by the direct application of high-tension electric discharges from wire "networks" on the fields, as is being done even now in isolated cases in Germany, England and America. And perhaps also the farmer who cannot buy his current cheaply will produce his own alcohol, for operating his engines, from the waste products of his crops. —Shop Notes Quarterly.

GASOLINE ENGINES ON FARMS.

George Ethelbert Walsh, a writer in "Harper's Weekly," says over 250,000 gas engines are working on farms in this country. "These engines," he continues, "have displaced, it is estimated, at least half a million horses and mules, and reduced the 'hired man' problem to an irreducible minimum."

He then says that "the substitution of steam for horsepower on our farms was of value only to the big bonanza farms." The small farmer could not afford the expense involved in the use of steam, but the gasoline engine just fits his case, and all over the country farms of from fifty to one hundred or more acres now have gas-explosion engines installed on them to do much of the work formerly requiring hired men and horses. These engines range from three to five horsepower up to from fifty to sixty horsepower.

The work they do is varied. Small ones are employed for churning, pumping water for stock, cutting hay and fodder, sawing wood, shelling corn and operating sewing machines. Larger ones are used for cutting corn for ensilage, grinding feed and threshing.

On the big farms of our own and the Canadian Northwest, large traction engines are employed, and the huge grain crops of that region are threshed with the power they supply.

The interest farm boys show in these engines is such that it is believed they are keeping many boys

We install complete in every particular anything from 1 to 60 horse power

FAIRBANKS-MORSE & CO.

425 East Third Street, Los Angeles, Cal.

with a mechanical turn on the farm. One sixteen-year-old boy in Colorado utilized the gasoline motor of a runabout as a combination header and pushbinder in an 800-acre field. Another lad rigged a six-horsepower second-hand motor engine up in his woodshed, where, through a system of belting, it drives a churn, a corn sheller, a grindstone, a sewing machine, a hay cutter and a washing machine.

If there are farmers who want to keep their boys on the farm and have found other inducements have failed, let them buy a new or second-hand gasoline engine and put the boys in charge of it. The use of these engines by farmers in the East is only in its early stages as yet, but already they may be found on many farms in this section and their number will soon be much greater than it is now.

INTERSTATE WATER RIGHTS.

By G. N. Houston, C. E.

One of the most important questions affecting Colorado today is the matter of interstate water rights. This state is in a very enviable position with regard to water. Practically all the streams in the state rise within its borders and the question naturally presents itself, has Colorado the right to use all these waters without regard to the adjoining states? We have assumed that we have, and have proceeded to appropriate all we could get sometimes, as in the case of the Arkansas river, leaving nothing for the people of Kansas. This gave rise to the famous Kansas-Colorado case which was decided in 1907 by the supreme court of the United States.

The state of Kansas sued the state of Colorado, claiming that the people of this state had appropriated and used all the waters of the Arkansas river, thereby damaging the state of Kansas.

I will quote a paragraph from the conclusion which gives a very concise statement of the opinion of the court.

Summing up our conclusions, "We are of the opinion that the appropriation of the waters of the Arkansas by Colorado for purposes of irrigation, has diminished the flow of water into the state of Kansas; that the result of that appropriation has been the reclamation of large areas in Colorado, transforming thousands of acres into fertile fields and rendering possible their occupation and cultivation when otherwise they would have continued barren and unoccupied; that while the influence of such diminution has been of perceptible injury to portions of the Arkansas valley in Kansas, particularly those portions closest to the Colorado line, yet to the great body of the valley it has worked little, if any, detriment, and regarding the interests of both states and the right of each to receive benefit through irrigation, and in any other manner from the waters of this stream, we are not satisfied that Kansas has made out a case entitling it to a decree. At the same time it is obvious that if the depletion of the waters of the river by Colorado continues to increase, there will come a time when Kansas may justly say that there is no longer an equitable division of benefits, and may rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes.

"The decree which, therefore, will be entered, will be one dismissing the petition of the intervenor, withqut prejudice to the rights of the United States to take such action as it shall deem necessary to preserve or improve the navigability of the Arkansas river. The decree will also dismiss the bill of the state of Kansas as against all the defendants, without prejudice to the right of the plaintiff to institute new proceedings whenever it shall appear that through a material increase in the depletion of the waters of the Arkansas by Colorado, its corporations or citizens, the substantial interests of Kansas are being injured to the extent of destroying the equitable apportionment of benefits between the two states resulting from the flow of the river. Each party will pay its own costs."

The last portion of this paragraph is especially interesting as the United States Irrigation Company, a Kansas corporation, has recently started an action against certain Colorado irrigation companies in the Arkansas valley, claiming that they have a prior right to certain waters of the Arkansas.

This involves the broad question of whether priority of appropriation is to apply to the whole stream from source to mouth regardless of state lines, or whether the people of this state, for instance, can appropriate and use all the water to the exclusion of prior appropriations in states farther down the river.

To the person not familiar with the use and distribution of water this may seem to be a very simple matter, and if he has no personal interests at stake he will be apt to decide in favor of priority right on the whole stream. There is, however, another phase of the question, that of maximum beneficial use.

Suppose this case, for instance: A, B, C and D have equal appropriation in the order given. A's appropriation is earlier than B, C or D's, but he is located several miles below them on the stream. Assume that the bed of the stream is sandy, such as is commonly found on the plains. There is sufficient water passing D's headgate to supply three out of four of these rights, but in order to carry A's appropriation down to him we are obliged to run three times his appropriation past B, C and D. That is, we waste twice as much water as we put to beneficial use. Many water commissions in this state have faced a similar problem.

Where there are reservoirs this can be solved by an exchange of reservoir water farther down and nearer A, for the water in the stream near B, C and D. Where no exchanges of this kind can be made the law of prior appropriation requires A to be furnished first, but it would seem that the interest of the public in general would be better served by a more economical use of the water. This matter of interstate water rights has come up between Wyoming and this state in connection with the appropriation on the Larimer river made by the Greeley Poudre Irrigation district.

Also on the Rio Grande river in connection with the Engle dam project of the reclamation service in New Mexico, which was discussed in the daily papers and at the irrigation congress held at Pueblo recently. This is only the beginning of the trouble as the question will ultimately arise between this state and all adjoining states. I would suggest that matters of this kind could be settled far more satisfactorily and with less cost to the states concerned by a commission appointed by each state to be known as the interstate water commission, of the states appointing the same.

In conclusion I would say that while Colorado started on its career as a mining state and has risen to its present importance on that foundation, it does today and will henceforth depend upon irrigated agriculture for its maintenance and further development. —Irrigation Age.

ECONOMY IN THE USE OF WATER.

The science of irrigation is as yet hardly out of its baby shoes, and it goes without saying that the next ten years will witness a tremendous development in this direction. As the principles of irrigation are better understood and practiced, the benefit of them will become apparent more and more. As a matter of fact, irrigation should by no means be confined to arid or semi-arid countries, but can be and should be applied judiciously everywhere, where farmers are raising vegetation. Even countries having an annual rainfall of 40 inches or more will experience at times the effect of a drouth which will cause a complete or partial failure of crops; this could be relieved or entirely prevented where a partial system of irrigation is maintained so that in case of a failure of rains to arrive at the right time the farmer can turn his water into his land and supply the deficiency.

As the irrigated areas are constantly increasing the matter of economic use of water is receiving attention. This is a very important subject and should be followed up with the most persistent efforts. If conservation of natural resources means anything it means that there should be no waste; it does not mean that our forests or water-falls should be fenced in and kept from being used; this would be utterly foolish and keep the people from their heritage; but it means that our national resources should be so handled that they will serve the present generation as well as succeeding generations and hence economy in their use is an important necessity.

Economy in the use of water for irrigation purposes is necessary in order to expand the number of acres available for irrigation. It is easily understood that when the pioneers took hold and developed projects it was done on lines of the least resistance and least cost. Thus water was led along rough ditches to the nearest land and the tracts thus irrigated produced splendid results. No one made inquiries as to the quantity of water which actually leaked away from the ditch and was thus wasted. As the value of irrigated land is constantly rising the value of the water thus wasted becomes apparent and means are discussed and adopted to conserve this wasted water; how to accomplish this result to the best advantage is one of the principal problems in irrigation at the present time. —Irrigation Age.

Drinking a great quantity of water with the meal is a bad habit, for frequently it is taken to wash the food down, and in this way hinders perfect mastication. The diet of the growing child should receive the mother's most earnest care and attention. Variety should be sought for; and salads, highly seasoned meats, pie and all kinds of fried foods should be avoided.

San Diego County reports promise of immense hay and grain crops.

CAMPBELL SUB-SURFACE PACKERS

We are the sole manufacturers of this famous Sub-Surface Packer, the only one made.

This is the one that you have heard everyone talking about.

Send for our Special Pamphlet on Sub-Surface Packing, the best known system for "dry farming," a method of absolutely insuring bumper crops with a minimum rainfall—the salvation of semi-arid regions.

Made in Three Sizes, with 10, 16 and 24 wheels, is heavy and strong, and the frame is made to carry all the extra weight required. Write for Catalog No. V

Parlin & Orendorff Co.,
CANTON, ILL.

EUCALYPTUS SEEDS

In large or small quantities, 33 kinds to select from. Write for free pamphlet, "Eucalyptus Culture." It gives full directions for sowing the seed, raising the plants and planting out into the field, together with descriptions of all the leading species, giving their uses and the localities to which they are adapted. Sample packets 15c each, 2 for 25c, 4 for 50c, 9 for $1.00. Choice Flower, Garden, Tree and Palm Seeds, Roses, Flowering Plants, etc. Catalogue mailed free upon application.

Entomology and Bees

THE BEST KIND OF BEES.

By W. A. H. Gilstrap, Ceres.

Just what variety of bees to raise or what variety is suited to a given locality, has been very widely discussed. After the black bee was introduced in America during early colonial times, it was simply "Hopkins' Choice," till about 1860, when the Italian bee was safely landed on our continent, and it soon won general preference on account of its many superior qualities. But it was not entirely to the good, as all with which man has to do in this life seems, like himself, to "need fixing."

About 1880 the Cyprian, Holy Land and Carniolan varieties were brought over and later Punics (from Tunis, Africa), Banats, Caucasians and possibly Adells. Adells were bred for years by a man who gave conflicting reports of their origin. They were possibly a sub-variety of Italian or Carniolan. Probably no one now breeds them.

Punic bees were freely advertised about 18 or 20 years ago and sold freely at fancy prices until they became known—that settled them. Still I should like two colonies of them now to build queen cells, which is a very pronounced trait with them and probably the only real superiority of that detestable variety.

Cyprian bees are great workers, but cap their honey with a watery appearance, as the comb is put down on the honey without the usual air space between. Twenty years ago, or more, I bought a colony which was probably pure; they were splendid workers and furious stingers. In my absence some enterprising party wanted their honey and burned the bees to get it. No wonder.

Some years ago I bought Holy Land bees from different breeders, as they were supposed to build queen cells better than Italians, but they proved little ahead with me—not enough to pay for destroying their drone brood every two weeks, and their temper was fierce.

Carniolan bees are better tempered than Italians. When you can handle them without smoke they stick to combs nicely, but are easily shaken off. It does not take much smoke to make them stampede furiously. Their excessive swarming instinct makes strong colonies scarcer than with Italians, despite their wonderful egg laying, when kept in large hives for extracted honey. This is their behavior where the honey flow is light, till July. In that case swarms are due from March to October. Crossed with Italians they are little or no crosser than Italians, do not congest the brood chamber with honey so readily and are surely a pretty bee, but can hardly be trusted in an out yard on account of their swarming, although not so bad in this respect as pure Carniolans.

It is my opinion that Italian bees will maintain their popularity against any bees so far introduced; but it is hard to say what particular type will grow in popularity as the years go by, although Goldens seem to be taking the lead now and there are different degrees of golden. Certainly none of us want bees so dark that they must be filled with honey and placed on a window, as some of the imported Italians are, to see the third ring, unless there is some intrinsic value to compensate. The ability of the Golden Italians to withstand black brood is greatly to their credit. Some bright yellow bees are surely good workers and have good dispositions, while others are not, the same as their darker relatives.

Eight years ago I sold Mr. C. K. Ercanbrack, Lovelocks, Nev., over a hundred queens and was sending more the next spring when foul brood (American kind) broke out strong in my home apiary and I wrote Mr. Ercanbrack that I was done with commercial queen raising on account of the disease; when he replied that he wanted the queens, being satisfied I would use healthy honey in the candy for the shipping cage. This set me to experimenting, reaching the conviction that no variety of bees can withstand American foul brood, and that it is never carried by queens from foul broody colonies if cage provision is healthy. There is no foul brood here of late but I remember it as an enemy.

WHY WOMEN SHOULD "KNOW BEES."

It is very pleasant, indeed, when all the members of a family are interested in the same pursuit. There is a chumminess about it that cannot be obtained otherwise. Take the matter of flowers, for example. If a woman is very fond of them, and her husband regards them as he would so many weeds, then at least a part of her enjoyment in them is taken away. This same truth works out to a greater extent in a business way. Take a bee keeper. If his entire family is interested in bees, his pleasure is greatly enhanced, as well as his profit in the business. No doubt there are many more wives, daughters and sisters of bee keepers that are efficient helpers than we know anything about, for they are very often the silent partners, although their help may be the means of spelling success instead of failure.

In bee keeping, as perhaps in no other business, it is difficult to obtain expert help at the critical time it is needed. So many people are afraid of bees that, indeed, it is almost impossible to obtain any sort of help. In case of sickness of the bee keeper, what a comfort it is if some member of the family is able to run the apiary until he is fully recovered; in fact, that recovery may be materially hastened if the mind is fully at rest in regard to the bees. Indeed, it might in some cases be the deciding factor between life and death, for worry is not an aid to recovery.

Death has left more than one poor woman with an apiary, like a white elephant, on her hands. Perhaps she has been in the habit of doing certain portions of the work successfully, but as to running an apiary independently she is utterly helpless, consequently she must dispose of her bees at whatever she can get for them, and that generally means at great sacrifice. On the other hand, if she is able to care for the bees, she is independent, and can make her own terms. Even if she does not intend to keep the bees permanently, she can hold them until she can dispose of them at a profit.

Wouldn't it be a good plan for every bee keeper to have at least one member of his family perfectly able to care for the apiary in case he should be called upon to do so?

Another important item is well worth considering. Did you ever notice, when two bee keepers meet, how promptly the stream of bee talk begins to flow? One of the chief delights of a bee keeper's life seems to be to talk with some other bee keeper. What a world of comfort it would be to him if a wife or daughter were familiar with the ins and outs of bee keeping, so that he could talk things over whenever the desire should move him.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Loquats Not Bearing.

I have several loquats five years old which have not yet borne. Is there any way to induce them to bear? Trees are healthy and vigorous.—Subscriber, Los Angeles.

Loquat trees should bear at five years of age, though these trees may yet show their quality and prove profitable. The safest way, however, with these trees is to bud or graft to varieties known to bear desirable fruit. Seedlings of loquats, as of other fruits, vary, and while you may secure a superior fruit, it is not probable.

Temperature of San Jacinto.

What is the lowest temperature of the San Jacinto Valley?—Subscriber, Los Angeles.

We will ask some of our San Jacinto subscribers to inform us, if they will, on this point. We have seen orange trees growing in various parts of that section of Riverside County, so we assume it is not very cold, though doubtless there are low sections which might be too frosty for profitable citrus culture.

Citrus Nursery Stock.

Which is the best kind of orange seed to plant for nursery stock?—Subscriber, Visalia.

Probably three-fourths of the nursery stock now being grown is on Florida sour root. In the bearing orchards, the sweet predominates. The greater freedom from gum disease of the sour stock, together with its hardiness and long root system, is causing it to be used more every year.

Bees and Pollination.

Are bees necessary or beneficial in orange or lemon groves? If not helpful to these fruits, what sorts are benefited?—B. B., El Cajon.

We do not think that bees are necessary to the pollination of the blooms of citrus trees, but we do not question they may be an aid to a certain extent. Blossoms of some trees are known to be sterile unless pollen is brought from other blossoms by bees or some insects. This is thought to be particularly true of apples, pears and some others. In any case we would prefer to have the bees around.

Blue Andalusian.

Please give Standard requirements for Blue Andalusian. — Subscriber, Cool.

The Andalusian is next in size to the Minorca, and is larger than the Leghorn. The combs of both male and female are considerably larger than the American type of Leghorn. They are rather more erect of carriage than the Minorca. The shape is a compromise between the Leghorn and the Minorca. While they are Mediterranean in shape, they do not conform exactly to either the shape of the Leghorn or Minorca. They have been bred with a body color that might be described as a soft bluish tint. The main body color is a glossy bluish-black, the feathers edged with a darker shade of color. Beak, shanks and toes of a leaden-blue color; eyes, face, comb and wattles bright red; earlobes white. The most beautiful Andalusians have a softer bluish tint in body color than would be described as a bluish black. This color throughout the female, and upon the breast and underbody of the male, is most attractive. Naturally, the top color of the male is very much darker than the other portions of the plumage. The main tail or sickle feathers are bluish black, which usually conforms to the shade of the breast color. The general description of color for the female would be a lighter shade than the coloring of the male.—Perfected Poultry of America.

Cattle of Denmark.

Answering a query which was made in these columns some weeks ago regarding the breed of dairy animals in Denmark, we have recently been given information by Mr. Pind, a graduate of the University of that country, and he says that the breed is called there the Jylland. It has the black and white characteristic of the Holstein-Friesian, in fact, it may be said to be practically the same as the Holstein-Friesian. Another breed less extensively used in that country is more like the Durham and is a decided red, called by the people there the Angle. Many Jerseys have been introduced, but on the whole the preference is for the larger breed, or, in a word, the dual purpose cow.

Name Wanted.

If "Subscriber, Corning, Tehama County," will write the Cultivator giving his name and sending 50 cents, we will secure for him publication on "Squabs for Profit."

Shoat Blind.

I have a shoat, seven months old, apparently in fine condition, except that whenever he is fed, his eyes, which in their natural position show but slight inflammation, will begin to turn to the rear; this continues until iris and pupil are completely turned back and hidden and only the muscles are seen and fill the eye socket; at first white, when the shoat has fed for a few moments the membrane becomes surcharged with blood and very red; during this time, and until he stops feeding, he is blind. This may be common to you, but as I have never heard of it before I may not be able to help you much in explaining conditions, but I append a few which may or may not have had any influence in the matter: Was not made a geld until he was six months old. Was confined at night with several others in a small, not very well ventilated house where there was considerable crowding. In the field where he and his companions ranged there is a stinging nettle growing, the varfety being unknown to me. All of this lot of pigs were affected more or less in the way of inflamed eyes, but none so much as he. The real cause of his condition may have escaped me entirely, but this is all I can think of, except I might add that they have had but a small ration of corn, most of the feed being rape and vetch.—C. O. N., Bostonia.

This disease is new to me. I should look to the cause as the stinging nettle or some other local condition of irritating dust. I would suggest bathing the eyes with a mild disinfectant. A solution of boric acid is always good. Buy the crystals at the drug store, put into a bottle, and fill the bottle with hot water, then stand it in hot water covered. About 4 per cent will dissolve, which is the right strength to use for bathing inflamed eyes. I should take the pigs out of this pasture until I was sure it was the cause of the trouble. Separate them out, giving the sicker ones the present pen and putting the well

BUY BABY CHICKS NOW--Special Prices.

We have 5000 per day of most all standard varieties of chicks. Right now we are making special prices on chicks in lots of 100 or more. Send today and state what kind of chicks you wish, and we will be glad to quote the price. We sell hatching eggs of all standard kinds, also cocks, cockerels, and laying hens and pullets.

Write us your wants today. Largest Baby Chick Dealers in the world. We handled 23,000 baby chicks last Wednesday. That's the largest hatch ever made in one day in California. Get the free 64-page catalog; send today.

ones away from them. The turning back of the eyes and bulging of the muscles would indicate a touch of meningitis if it were not for this eye trouble with it. High feeding is sometimes the cause, and if you could stop feeding him at all for twenty-four hours, giving only plenty of water to drink, and then give him green feed entirely for a fortnight, it should change conditions. Tear off some of the boards from the house and put on wire netting in the place of the boards. A pig house ought not in California to have more than three tight sides at any time, and the fourth of netting. This cuts off drafts and makes an airy house.—M. E. S.

Leaf Curling Aphis.

Can I use lime-sulphur spray recommended for leaf curling aphis at this time?—Subscriber, Elk Grove.

This was referred to W. H. Volck, Horticultural Commissioner of Santa Cruz County at Watsonville, and he writes: "The lime-sulphur spray cannot be used after the trees come into foliage, but nicotine spray should be used." The following formula is recommended: "Black Leaf 40" 1 pound (about 1-10 gallon), whale oil soap 10 pounds, water 200 gallons.

Thinning Fruit.

Please give best method of thinning fruit on apricots, also best method of propping or supporting overloaded limbs.—J. W. M., Saticoy.

About the only method of thinning fruit is to thin. Some have gone at it with bamboo poles knocking promiscuously and often removing whole bearing twigs instead of one or two fruits which should be taken off. It is slow and it is expensive, but hand thinning so as to leave a few inches between fruits will give larger and better fruit. The only way to do this is to get right into the trees on step ladders and do the work by hand. If any of our subscribers have a royal road we would be glad indeed to hear from them. Propping may be secured by the use of the ordinary "wire props" which are really short bent pieces of wire so constructed as to slip over a one by two inch strip of lumber or stake. The wire is adjustable so that it may be raised to any height on the strip. The strips are bought by the thousand and of length great enough to reach the higher limbs. Another form of support is a wooden piece shaped so as to fit the limb, attached to which are wires and from them other wires or cords are used to support this limb to another on the opposite side of the tree. These are somewhat cheaper but require longer time to install. This support also claims the advantage of not being displaced by the wind. The use of the ordinary crotched stick is objectionable because of possible injury to bark of the tree, also because of care required to place it firmly.

Branching Young Trees.

I have just set out apricots which I cut back to 20 or 24 inches. Now as the young branches come out on the trunk how long should they be left and how should they be distributed along the trunk?—Subscriber.

The principal factor is to permit those to grow that will make best balanced tree. It is never wise to allow two branches to come out at opposite sides of the trunk. Where this is done the tree is more liable to break. For instance, if four branches are to be allowed to make the foundation of the tree, one coming near the top on the west is balanced by another being allowed to remain a few inches below on the south, still another on the east and again at another place one on the north. Of course, all trees have a character of their own and an ideal distribution cannot always be made. On 24-inch topped trees it would be wise if the branches could be brought out within the upper 12 to 14 inches. The branches should be allowed to grow till the dormant season when they will in turn need topping back, that is, unless one branch seems to be taking all the sap and making all the vigorous growth. Then a pinching back of the vigorous branch should be followed.

Gophers.

What is the best plan for catching gophers?—M., Saticoy.

The best plan for catching gophers is to have a quantity of the best gopher traps the market affords. Some prefer the steel trap; others the box or ordinary wire trap, which has suited us the better. Enough traps should be on hand so that the entire place may be covered at one time. Then an early morning trip over the orchard enables every showing of gophers to be opened up, usually two in each runway. Sometimes a slight excavation above the outside approach is sufficient, but usually we prefer to dig down until the run opens out two ways. A few hours later, or possibly the evening of the same day, a visit will show what work has been effective, and where a gopher has been caught the hole may be closed. There is no necessity of leaving the trap, once a gopher has been secured from a run. If the runs are then tamped shut, any other work will show up the following morning.

A very small quantity of strychnine placed in the middle of a good fat raisin dropped into the run is good for poison. On a very large ranch, where help is limited, poisoning answers very well, but in an orchard where a few hours delay may mean loss of a valuable tree the trap is safer. Instead of the raisin, a piece of potato, carrot, or almost any small similar conveyor for the poison is satisfactory.

Spray for Codling Moth.

Does it require the same strength of Paris green to spray codling moth on apples as on pears? If not, what strength?—Subscriber, Elk Grove.

There would be no material difference in the two cases. We have seen peaches and plums sprayed with the usual strength of Paris green which were injured, but either peaches or pears will stand one pound to 200 gallons unless unfavorable weather conditions prevail. However, we think the arsenate of lead formula given in the issue of November 3 is to be preferred.

Millet.

Will millet do well in this section? How long does it take to mature, and may it be used as second crop after oats?—J. A. M., Tulare.

Millet sometimes does well, but is quite uncertain in its results. On subirrigated land it does better than on land that is not moist enough and has to be irrigated. We have never succeeded in raising it as a summer crop, but have used it for January seeding with good success. Sorghum will give you best success for a second crop here in this region.—M. E. S.

Indigestion.

We have several hundred thrifty appearing incubator chicks from two to three weeks old. Suddenly there will be one or two that look sleepy and full; if let alone they soon become limber and almost lifeless. On examination there proves to be wind in the crop with a dark watery fluid. One that we tried to relieve by massaging the crop got all right, but the others during the same treatment died almost instantly, and from one the liquid ran from the mouth and seemed a little bloody. Pricking the crop to let the air out caused in one instant death. We feed in litter chick food and broken rice, with plenty of grit and charcoal, occasionally boiled rice, corn bread, hard-boiled eggs or cottage cheese for a change. Can you tell us the cause and the cure for chicks thus affected?—G. B. San Marcos.

Your chicks are without doubt suffering from acute indigestion. The usual cause of this in very young chicks is faulty incubation. The chicks have either been chilled or overheated in the last week or the last few days in the incubator. This has so weakened their bowels that they cannot digest the food, which consequently goes bad, ferments, forms gas, the wind in the crop, and finally causes blood poisoning. The sleepiness which you describe is a symptom of poisoning; the limber condition also is another symptom. Older chicks have almost the same symptos from eating musty or mildewed food or chick food that contains bad or spoiled animal food. The animal food may become bad if you have kept it in a damp place, or if mice or rats have run over it. It takes very little to spoil even the best beef scrap if kept in a damp place. Your feeding appears to be all right. Be careful not to cook the cottage cheese too much; it should not be heated above 98 degrees or it becomes so tough and rubber-like that it will give indigestion.

The cure is not easy for any kind of poison; in fact, prevention is here much better than cure. Be very careful to have the food perfectly dry and also smelling sweet and without dust in it. Sometimes a small dose of Epsom salts if the chick seems feverish is a help, and a little bicarbonate of soda in the drinking water, a level teaspoonful to a quart of the water, and a raw egg beaten up with the same amount of olive oil, a small amount of this given every two or three hours. The oil is healing and the egg is nourishing. One teaspoonful of this is the dose for a full-grown hen, and of course less in proportion to the size of a chicken. For a full-grown hen that is suffering from ptomaine poison or limberneck a teaspoonful of castor oil with ten drops of turpentine is the best dose, following it with the egg and olive oil.—A. B.

An Economical Adjunct of the Garden.

Kale.

Will you please give me information about kale, what variety to plant, how much seed to the acre, what time to plant, and its value as a cow food as compared to ensilage?—G. A. O., Oceanside.

Kale is a valuable cow feed, but not as good as corn ensilage—is my impression. I cannot give from memory the names of the stalk variety. Look it up in the nursery catalogues. There is considerable grown around Fresno by Italian gardeners.—M. E. S.

Sulphuring Grapes.

Will you kindly answer if you think it necessary to sulphur Muscat vines that were thoroughly sprayed with bluestone and lime in the winter?—J. H. B., Kingsburg.

I always watch the vines closely. In most of the years the use of sulphur is not necessary, but sometimes there is infection from neighbors, and sometimes the bluestone has been too much washed off by rains in the spring. In twelve years I have had to use sulphur twice in a small section of the vineyard, on eight or ten acres out of two hundred and fifty, so the protection is reasonably certain. After all, in growing a crop of grapes, while we are trying to save all we can, we are not going to lose the grapes for a little extra labor. The Bordeaux certainly does save several hundred dollars every year for us. I hope it may do the same for you.—M. E. S.

Pigs on Alfalfa.

How many pigs will an acre of alfalfa feed when pastured, turning the pigs on when weaned at eight weeks? Will they do well on the alfalfa alone until a few weeks before butchering, or would it pay better to buy grain and feed some with the alfalfa from the time they are weaned until about ten months old? Will have about 100 young pigs, and will have about twenty-five gallons of skim milk a day that we will feed them. Is there danger of cholera in this part of the state, and is there a remedy?—Subscriber.

Twelve pigs at weaning time should find ample food on an acre of alfalfa. It pays well to give them a little grain with the alfalfa to gain increased size and weight. The skim milk is good, and if a handful of rolled barley is added will do finely. Cholera is an introduced disease, and if there is no source of contamination it is not likely to break out. The government has a vaccine for cholera that renders those exposed immune. Write to the Experiment Station, Berkeley, for particulars.—M. E. S.

Locust Posts.

Regarding locust for fence posts beg to say that I have had long experience with all of the hard woods in the East. Also the gum or eucalyptus of this state, and I find that there is no comparison as to keeping qualities when put in the ground, the locus being far superior to any of them I have seen locust post that had been in the ground te nyears and were apparently in as good condition as when put in. As to the time of cutting would recommend the dormant period —S. N. Benton, Azusa.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Sweeney.

A colt five years old was sweeneyed about a month ago, in the shoulder. Can it be cured?—Subscriber, Orange Vale.

The subscriber does not state whether the animal has been lame. A perishing of the muscle without lameness is not a serious ailment, though sometimes difficult to remedy. Prepare a liniment by mixing turpentine one part, ammonia one part and sweet oil two parts, and apply this twice daily with vigorous hand rubbing. If after three or four weeks this has failed, consult some qualified veterinarian regarding subcutaneous injections.—F. G. M.

Weak Tendons.

A draft colt two days old walks on its ankles or fetlocks. The front cords seem to be contracted, and the back ones relaxed. Kindly prescribe through the Cultivator and oblige.—Subscriber, Winchester.

Young colts with relaxed tendons usually recover without treatment. As the muscles gain strength the tendons gradually assume their functions. However, if improvement is doubtful or too slow, braces or splints may be bandaged to the limbs, extending from a point just below the knee or hock to the bottom of the foot. Guard against excoriating the skin by padding well with cotton before bandaging.—F. G. M.

Abscesses.

A cow five years old, due to calve in May, has two lumps on her side. Eight weeks ago one lump broke and discharged bloody pus, but closed again, and now it has grown to be larger than before.—Subscriber, Porterville.

Puncture the abscesses with a sharp knife, press out the matter, and fill the cavity with a strip of clean cloth saturated with tincture of iodine. Remove and renew the dressing once daily.—F. G. M.

Discharging Sore.

On the dge of my horse's ear near the head is a sore which occasionally discharges pus resembling vaseline. Kindly describe and advise a remedy.—Subscriber, Mt. View.

A deformed tooth sometimes grows on the bones which contain the vital organs of the ear. Fluids forming around the tooth may erupt at the base of the ear. This, the surgeon would consider as one of the possible causes of the trouble. Endeavor to locate the irritant, which may be a thorn, splinter, tooth, etc., by carefully introducing a slender probe into the tract. An operation is the remedy suggested.—F. G. M.

Wire Cut Involving Joint.

About one month ago my horse was cut in front of the hock joint by a barbed wire. The wound seemed to be doing well until a few days ago when a knot which appears to be proud flesh came out of the cut place. Now it has opened at another place on the joint. The joint is swollen and the horse is very lame. In your answer please tell me how to treat proud flesh.—Subscriber, Button Willow.

The symptoms given indicate that the joint is open and the synavia or "joint water" is escaping. If this opinion be correct the horse may not recover. Bathe the limb twice daily with water as warm as can be endured and cleanse the openings by injecting peroxide of hydrogen with a syringe.

Exuberant granulations ("proud flesh") may be removed by the use of powdered bichloride of mercury rubbed into the raw surface every fourth day. Cleanse the surface with dry cotton before applying the powder. Do not apply the powder when the wound is bleeding. Discontinue treatment when the granulations are reduced to a level with the skin.—F. G. M.

Liquid Sulphur?

In prescriptions for the cure of mange and itch you have suggested the use of liquid sulphur. A "Liquid Sulphur Compound," which is a patent preparation, seems to be the only form of liquid sulphur obtainable and this is expensive.—Subscriber, Jamacha.

Presuming that druggists conceded the so-called "Liquid Sulphur Compound" to be practically the same as the concentrated solution of lime and sulphur recommended by the Bureau of Animal Industry for parasites of the skin, it was supposed this preparation would be supplied. The concentrated solution may be prepared by mixing lime (freshly slaked) 10 ounces, sublimed sulphur 16 ounces, then add the mixture gradually to one gallon of boiling water and boil under constant stirring about 1½ hours; allow the solution to stand till clear and pour off the reddish brown liquid for use. When using dilute with two parts, or an equal quantity of boiled oil. An inexpensive but reliable remedy for various skin diseases.—F. G. M.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Account Due Wife from Husband.

If a woman separated from her husband and he returned and agreed to buy poultry from her at a certain price and took them away without paying for them and later she returned to live with him and he traded the poultry for pigs and later sold the pigs and refused to pay his wife, can she secure payment for her poultry?—C. J. M., Kerman.

A wife has the right to sue her husband for money due her the same as she might sue any one not related to her, and a lawsuit seems to be the only way to finally terminate such family disputes. If they are not amicably adjusted, they generally result in a divorce case in which property rights are settled by the court.—E. L. P.

Location of Corner.

A quarter corner on east side of Section 5 with government mark was found to be 40 feet north and 20 east of where the corner is placed when straight lines are run from section corners established from other government monuments. This stone was found eleven years ago and location recorded by surveyor when surveying the southeast quarter. Witnesses certify that it was loose at that time and the surveyor recommended that it be made secure; it was then cemented in place. Using this stone as corner it makes crooked lines. If the matter is taken to the courts what would be the decision in the case?—Subscriber, Pomona.

I presume that the subscriber desires to know whether the stone monument or the lines as they should be run, govern the description of the lands cornering at the quarter corner mentioned; but he does not state the claims of the respective owners of property cornering at that place, so that it is only possible to answer the question in a very general way. When permanent and visible or ascertained boundaries or monuments are inconsistent to the measurements, either of lines, angles or surfaces, the boundaries or monuments are paramount. Between different measurements which are inconsistent with each other, that of angles is paramount to surfaces, and that of lines paramount to both. As the inquirer seems to know for a certainty that the stone monument is out of place, and as it is apparently not a government monument, but one set in place by some private individual during the course of survey for his own benefit, it might be moved back to its proper place, and in the absence of any objection from adjoining owners, because of adverse possession of land up to the present location of the monument, or for some other reason, the correction might go unnoticed and become permanent.—E. L. P.

Residence in School District.

I am owner of land in two school districts, pay equal taxes in both Have I the right to send my children to either district, or can I be compelled to send children to district I am living in? Live close on line.—Subscriber, San Luis Obispo.

The inquirer is required to send his children to the school in the district in which he resides, unless he obtains permission, for some good reason, to send them to some other school.—E. L. P.

Contract Purchase.

Having purchased land under a time contract agreement, and paid down one-fourth of purchase price, find I can not make next payment on date it falls due but can pay all interest. Can I be put off this land immediately? To whom do the buildings I have erected on this land belong? The contract does not mention them.—H. W. H.

Whether the purchaser can be put off the land, depends entirely on the terms of the contract. A contract usually provides that time is of its essence, and upon a failure to perform any of the conditions required to be performed by the purchaser, the purchaser forfeits all rights and all moneys theretofore paid. Such terms can be waived, and it is impossible to give an answer to the question that would cover all possible conditions without making it too lengthy.

Assuming that you have forfeited your rights to the land under the terms of the contract, any buildings you have placed thereon would belong to the party from whom you purchased, if they are not mentioned in the contract.—E. L. P.

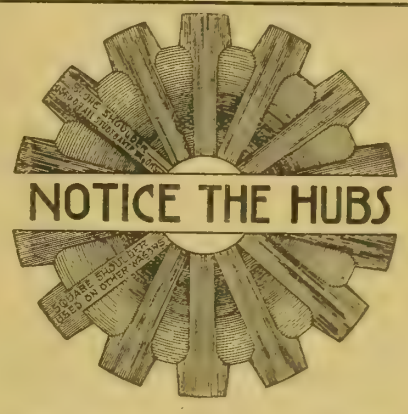
Half Sister's Share in Estate.

A (unmarried) died, leaving no will, and leaving no heirs except a brother and a half-sister. A's estate was acquired by his own earnings. All of A's estate went to A's brother. Was A's half-sister entitled to share in the estate? And if so, how would she proceed?—F. W., Los Angeles.

Kindred of the half blood inherit equally with those of the whole blood in the same degree, unless the inheritance came to the intestate by descent, devise or gift of some one of his ancestors, in which case all those who are not of the blood of such ancestors must be excluded from such inheritance. The sister should have petitioned the probate court in which A's estate was probated, for her rights, and not having done so, provided said estate went through the probate court, she has possibly lost all opportunity. If the estate was not probated, the sister can apply for letters of administration in the county in which the brother died, and can then have the probate court take jurisdiction of the property, and probably divide it. If there were probate proceedings and she had notice of those proceedings and did nothing, it is probably the best thing for her to in person consult a lawyer to whom she can detail all of the circumstances, and there might yet be some opportunity, if all of the facts are stated, to secure her share of the estate, unless she is excluded by the above paragraph.—E. L. P.

CELERY FERTILIZER.

A good celery fertilizer must be rich in nitrogen and potash. Well-rotted barnyard manure and unleached wood ashes are excellent, but where these materials cannot be had, commercial fertilizers containing a liberal amount of the above-mentioned elements will aid the crop beyond the belief of the inexperienced. Nitrate of soda will furnish nitrogen and kainit, sulphate of potash, or wood ashes will furnish the potash.—Michigan Farmer.



On the next *Studebaker* Wagon you pass on the road

Why aren't they split and cracked like the ordinary wagon?

Because the ordinary wagon hub is made from oak, a wood that splits and cracks very easily, while

Studebaker WAGON

hubs are made from *Eastern black birch*, a very springy, tough wood, chemically treated, with great weather resisting qualities.

Western birch is used by some manufacturers, but it is even poorer than oak. It is *brashy* and will not stand the strain.

Studebaker hubs cost more than any other hub on the market, but they are stronger and wear longer.

Another reason why you should buy a ***Studebaker*** from

Newell Mathews Co.

Established 1886

Los Angeles, California.

Mr. Fruit Grower:

That the ratio of available magnesia to available lime in the soil is one of the most important soil conditions you have to consider has been thoroughly proved and is being constantly confirmed.

You can never get satisfaction in fruit or tree until you have this condition right.

See my article in Covina Argus, March 25th, on this subject.

Seasonable Goods

Of special interest right now, are our Harvesting Machines, Hay Tools and Hay-Presses. We have made it our business to get hold of the best in these lines. We especially call attention to the following:

Deering Ideal Mowers; perfect shear-cut, ball and roller bearing—nothing better made.

Deering Ideal Self-Dump Rakes; with ball bearing wheels; strong, durable——first class in every particular.

Dain Buck Rakes and **Stackers**; scores in use in Southern California. They are built right and will positively carry the teeth off the ground when heavily loaded. Power lift—easy to operate.

Southwick Hay Press;—without question the best horse power press made. Many of our customers have averaged 30 tons per day or better for entire season's runs. We also have the Sandwich Engine Power Belt Presses—of wonderful capacity. Smaller Presses, too—all steel, self feed.

See us or write today.

Timely Ranch Suggestions

CAVE-MAN TO "CHOFER."

By John G. Bramhall.

Nearly fourteen thousand automobile licenses in California last year, and nine thousand the year before; probably twenty-two thousand this year! The honking habit grows with what it feeds upon. Thirty thousand automobiles chu-chuing up and down between San Diego and Klamath! What do you make of it? Is it all up with the horse? And is Ranchero's occupation gone? Not so. If we look carefully we will see that the joy-rider is passing, and the business man, including those of agricultural business, is coming into his own. Time was, when the old farmers shook their heads at the fast horse and the light road wagon, just as they shook their heads at the stage coach, and later the locomotive. And the cave-man, bewailed the reckless tendency of the times when his boy first put a bridle on a horse. But when the men on horseback started out to the hunt, the cave-man got left. Such is life.

"Of all the inventions of man," says Macauley (abbreviated), "the compass and the printing press alone excepted, those which abridge distance have done most for the benefit of mankind." The progressive man seeks to abridge distance and time. Make out as good a case for the tortoise as you can, we all realize that the hare is the superior animal, while alive. With all his reputation for steadiness on the job, there is no record that the shell-back was ever selected for express messenger. And the shut-in man is the cave-man; the man with an auto, whose son is perhaps building an aeroplane, is the free man, who lives and grows in the world of men.

California, thanks to the automobile, is doubling in area. The regions which cannot be reached, or which cannot communicate with the outer world, except in a very limited period of the year, and with much labor, are as if they were not, and their people might be skipped by the census man without much loss. But the power-wagon helps them out. The little gasoline spark is the Promethean torch, and all that sort of thing. One cannot but notice that the automobile, if we strike an average, is losing its character of luxury and exclusiveness and is becoming a business wagon, equivalent to a four or six-horse team. The old farmer never shakes his head at a four-horse team, especially if they are Percherons or Clydes. True, the auto used to get stalled, when it was young, but now it pulls out the stalled team and climbs the hill where the farmer used to lighten his load. The auto gets there, all right. And it brings the isolated valleys to the railroad and doubles the value of the way-back acres.

The Kansas bankers a year ago became conservative and felt it their duty to curb the reckless extravagance of the too prosperous farmers who were crazy (that was the word) to invest in automobiles. No matter if the farmer had a valuable property, clear of mortgage, he was told, gently but firmly, "no loans for motor cars." The farmers resented this guardianship, and many banks lost heavily in deposits. It is very true that "the autos take money out of the state." It is estimated that Kansas despite all remonstrances, has at least 12,000 cars, costing say $1000 apiece, $1,200,000 taken out of the sunflower state and sent east. And Nebraska has about 14,000; Oklahoma, (where the family conveyance consisted of a couple of tent poles drawn by a cayuse) has 8000 honk-wagons; Missouri, 14,000; Texas, 15,000, and so on. Over six million dollars, and half of it farmers' money, sent out of these five agricultural states to eastern manufacturers! But are there no returns, no compensation?

The writer of this talked recently with the manager of one of the leading automobile agencies in California. "Not a single automobile," he said, "so far as I know, has been sold to a man who had to borrow the money, and all paid cash. I am talking of sales to ranchers and farmers. The machines are not bought as a luxury, to satisfy a craving for speed, or an ambition for style, but as a necessity of their business, because gasoline power is cheaper and handier than horse power. The farmer who has once bought an automobile is like a woman who has bought a sewing machine or a power churn; he wonders how he ever got along without it. No, the farmer has little trouble about managing his auto and keeping it in repair; he has less trouble and expense than the city man, by half, because he knows how to handle machinery. I could give you instances by the score of farmers using the auto to carry cream or other produce to market, to go to town for needed supplies, or to carry their children to school. The auto is just as much a necessity for the farmer as is his team and wagon; in fact, it increases the efficiency of his teams without increasing the expense for feed."

And thus the original purchase money is brought back. We do not find people complaining of the extravagance of buying machinery for farm and manufacturing purposes, on the ground that it is sending money out of the country. We applaud every enterprise that tends to increase production and to multiply earning capacity. It is therefore a matter of gratification that the labor saving and time-annihilating automobile is multiplying in the land and that the introduction of power vehicles for freight purposes and general hauling, traction engines for miscellaneous farm work, etc., is growing. At the state and county fairs the uses to which the gasoline motor may be put in threshing, sawing wood, running feed grinders, and dairy machinery, pumping water, etc., as well as plowing and hauling heavy loads over rough surfaces, is practically demonstrated, and the uses of the auto fire engine and the auto school wagon are beginning to be realized.

The Kansas banker, it is reported, is no longer nervous about the farmer's extravagance, and the California banker, so far as we have been able to learn, has manifested no apprehension in that direction.

Are you wishing for something far beyond your reach? Go to work at once to make yourself fitted for that goal. Be true to every duty of today, remembering that it is by doing more than is required that you can fit yourself for a better tomorrow. And it may be when you least expect it that the better days will come.

RURAL SOCIETY.

Prof. L. J. Bailey, Cornell University.

The business side of farming has been so successful that the farmers have been able to move to town at fifty years of age, and so the country has been robbed of their influence in many ways, their farms have gone to tenants, and the social life has been broken up. Our state of civilization has not been successful in developing a type of country life that would wish to remain in its environment.

The easier questions have largely been settled, but we shall never develop a satisfactory system of country life until we settle the hard questions as well, the better schools, better roads, better church and social advantages. We shall even develop a better skill in farming than many of us have ever dreamed of.

I wish to ask you, as well as myself, whether the American farmer will hold his own. Will he be able to so manage his resources and privileges that he shall be able to remain on the land and become a part, an enduring part, of its social civilization? These are some of the most important questions before us today.

Cities always destroy; they never produce. The city sits like a parasite on the face of the country, absorbing the best from the country. The country always contributes to the city; the city never to the country. The cities could not exist but for the country. We have developed the city civilization beyond that of the country.

The first necessity is going to be to send broadly-trained men and women to the country. The weak spot is back of its business conditions. We must seek further than that. Concentration of all the forces that make for social betterment is one of the prime needs. The educational propaganda will be more effective than any other. A large part of the unrest comes from the poor school privileges that are too common in the country.

Let city and country folk work together on every public question; each is necessary to the other. Country people do not have a chance to express themselves by ballot or otherwise on city matters, and the larger proportion of population in the cities dominates the country to a certain extent.

Financial interests are now dominant; we shall pass that stage, and have a better social condition. It will take twenty-five years to balance up our society. Out of the movement will come presidents and country statesmen and a few governors. I hope it will not become a political movement. I will use all my influence to prevent the country life movement from having anything to do with partisan politics, because the movement is founded on facts, and not partisanship. I fear the conservation movement is to suffer by political favor. It is almost impossible to discuss in a sane and unprejudiced and scientific way any public question into which politics has entered. The tariff has been a conspicuous example. It has been impossible to discuss that sensibly for fifty years.

We must develop the ideals in this industrial civilization. There must be something in every business beyond financial gain if it is to make any final contribution to civilization. Developing agriculture is only a part of industrialism. A new social order must be developed in the open country, a new civilization, and every farmer must lend a strong hand.

We have been training our young men to be better farmers, but in that we have trained only one hand, the hand of individualism; we must now train the hand of social brotherhood. The open country must be made over, because civilization must be made over. The next generation must set themselves definitely to this work. In the consolidated school the children of the farm may be given the education suitable to their surroundings, and it may be made a rallying place for the community. The rural library is a fact, and I would not forget the country church as a great factor in what is to be a newer and better social state in the country.

We must develop the fighting edge. When a man ceases to be a conqueror he loses vitality. Militarism must pass out, but this does not mean that mankind must cease to contend. Being compelled to strive makes us strong. The Panama canal is the greatest humanizing experiment of the age. It is worth more in developing the fighting edge than ten times its size of armies. We must develop the fighting edge in argicultural combat, offset the effect of climate, insect enemies and fungous diseases. We may have made a mistake in teaching that farming was an easy occupation, when it is not, and never will be, because nature is its antagonist. It is a constant contest. We are now digging into our young folks the courage of science.

Agriculture is going to attract the hardy and rugged in the future, as it has in the past, who like to steel themselves against a worthy antagonist. I want every farmer to have in him the spirit of challenge, the fighting view. You can never develop a strong civilization until we do it. The open country must solve its own problems. It must have help from everybody and every source, but, after all, the country man must prepare himself consciously for it. This means we must have leaders.—Kansas Farmer.

EXPANSION BY THE GLUCOSE TRUST.

The Wall Street Journal reports that an official of the Corn Products Refining Company has stated that the company has gone into the business of manufacturing jams and jellies and is interested in others in the manufacture of molasses. We don't know how molasses is "manufactured," as we thought that was essentially a by-product of the sugar industry and that molasses could not be made as such. The Glucose Trust, however, is capable of wonderful things. During the last season it acquired the Novelty Candy Company and has been carrying on the candy business and is about to secure complete control of the St. Louis Preserving Company, in which it has held an interest for some time before. This latter company, in the production of jams and jellies, consumes about 25,000 barrels of glucose per year. It is the intention of the officers of the Corn Products Refining Company to erect a new plant for the manufacture of these jams and jellies at Granite City and to begin selling them under the Refining Company's own name. The reason given for entering into these new lines of business is to increase the consumption of glucose. An example is given in the candies of the Novelty Candy Company, in which an average of 50 per cent of glucose is used, while the National Candy Company in its products uses but 15 per cent. Many preserving companies use apple waste in their jams and jelles, because they say the public prefers it. The Corn Products Company uses about 80 per cent glucose in its preserves and is endeavoring to teach the public that its product is the better, by reason of this greater percentage. May the Lord help the consumers!—Louisiana Planter.

The Kerman Creamery has opened a milk-receiving depot at Dos Palos.

In the Cultivator of April 13, Mr. Tuohy, of the Tulare Grange, stated: "Perhaps the best object lesson in Grange co-operation in California is that of Soquel Grange. This Grange has made definite arrangements with the Rochdale store at that place to get certain articles at prices covering the cost of handling only to the Rochdale."

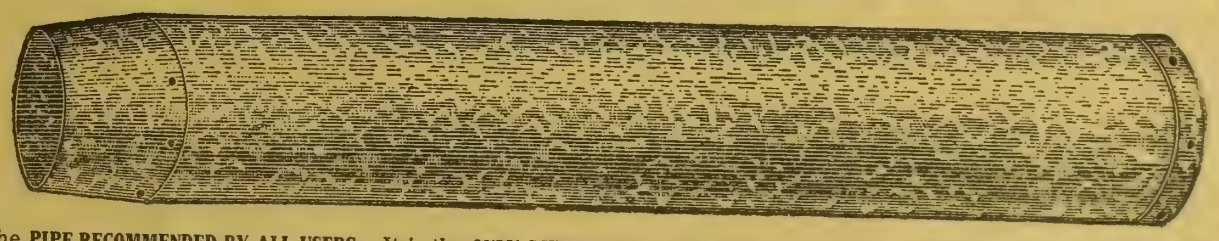
In reference to this, Mr. Arthur May, business agent of Soquel Grange, writes:

"I am not fond of rushing into print, but an article in the Cultivator of April 13 impels me to do so. Mr. John Tuohy, of Tulare, is certainly under a serious mistake. The Rochdale Store of Santa Cruz is not in the least connected with the Soquel Grange. I do the whole of the buying and selling of poultry foods for the Soquel Grange members, and have for over two years."

The foremost method of cultivating alfalfa is with the disk harrow, one of the most excellent farm implements ever invented. Alfalfa sown in the fall is almost invariably helped by disking the following spring, with the disks set quite straight, so as not to cut the crowns but to split them. It is usually well to follow this disking with a tooth harrow, with its teeth set straight. Occasionally in a dry summer the disk may be used to great advantage after the second, and possibly the third, cutting also. Many disk their alfalfa fields every spring, and some after each cutting; others do so only once in every two or three years, owing to weather conditions and the conditions of the alfalfa. In some instances the common harrow is used instead of a disk.

The disking has several beneficial effects. It splits and spreads the crowns, causing more and consequently finer stems to spring up, affording hay of the most delightful quality easily cured; it loosens the soil about the crowns, conserves moisture and destroys the weeds. There need be no fear of killing the plants if the disks and the harrow-teeth are set straight and weighted or otherwise adjusted to give direct and steady forward movement. As an implement for the cultivation and invigoration of an alfalfa field the disk harrow has no equal, and its frequent use is by those who know it best deemed quite indispensable.—From Coburn's "The Book of Alfalfa."

SAVE YOUR TIME WATER and GRADING BY IRRIGATING WITH AMERICAN SURFACE IRRIGATION PIPE



The **PIPE RECOMMENDED BY ALL USERS.** It is the **ONLY SCIENTIFICALLY CONSTRUCTED SURFACE IRRIGATION PIPE** on the market. **THERE'S NO ROUND SEAMS TO LEAK,** retard the flow of water or weaken the pipe. This pipe is easily handled and cheaper than flumes. It will last a life-time. For irrigating alfalfa it is the only pipe to use. We make **RIVETED PIPE AND TANKS.** Write for Illustrated Catalogue, also **SPECIAL IRRIGATION FOLDER** which may mean much to you.

American Steel Pipe & Tank Co., General Offices 342-43 Pacific Electric Bldg., **Los Angeles, Calif.**

Kellerstrass White Orpington Eggs, $2.00 per 15; $12 per 100. R. L. Warren, National City, Cal. R. F. D. 1.

POULTRY

1889-1911—Barred Plymouth Rocks, Ocean Blue Strain. Birds of our breeding made a phenomenal record in the hands of our customers this season. Won first place at five of the largest Coast shows, besides many shape and color specials. Fourteen silver loving cups were won by this strain. We won in every class at the big Los Angeles Show—something no other exhibitor of Barred Plymouth Rocks can claim. Every female in pullet pen for this season is a winner either in pens or singles. Every male heading cockerel mated pens this season is a winner either singly or in pens. We are ready now for your egg orders. Same old price—$3 and $5. Mr. and Mrs. D. T. Wieland, Moneta, Cal. Take Redondo car via Moneta avenue. Get off at Illinois street, right on ranch.

Cook & Kellerstrass Strain Orpingtons—"The Real Thing." The Standard Poultry Yards, 3944 Cleveland Ave., San Diego. Cook Black, Buff, and White Orpingtons. Eggs and baby chicks. Northrup S. C. Black Minorcas. Send for folder. C. A. Loud, Prop.

This is My Last Notice for the Season. Those who desire eggs from either "Kellerstrass" White Orpingtons or Buff Wyandottes should write at once and book orders. Orpington eggs 20c each, Wyandotte 10c straight. Good stock. Satisfaction guaranteed. Frank Haasis, Ontario, Cal.

Goose Eggs for hatching from the largest and best flock of Toulouse geese in California. 66 mature breeders, all 3 and 4 years old. No young birds in the lot, which contains a number of first prize winners. Eggs weigh one-half pound each. Price 35c or $3.00 for 10. Long Beach Poultry Ranch, cor. 10th and Walnut, Long Beach, Cal.

R. I. Reds—Much time may be saved in producing heavy layers by buying eggs from a breeder who has established a record by specializing in heavy laying stock. Eggs, hundred $5.00, finely pointed; 15, $3.00. "The Luedkes," Anaheim, Route 1.

White Leghorn and Black Minorca hens, one year old; fine layers. B. de Groot, Aptos, Cal.

Orland Hatchery—White Leghorn chix, $8.50 per 100. $80.00 per 1,000. Brown Leghorn chix, $8.50 per 100. P. L. Simpson, Orland, Cal.

Barred Rocks exclusively. Eggs $1.50 and $3.00 for 15. Hatched chicks 15c and 20c each. Fine young stock later. Correspondence solicited. G. L. Hawley, Madera, Cal.

Single Comb Brown Leghorn Eggs—$5 per hundred, $1.50 single setting. Mrs E. Foran, Box 445, Visalia, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately Allaway & Layton Co., 607 E. 3d St., Los Angeles, Cal.

FARM LANDS FOR SALE.

Owens Valley offers to the farmer unusual opportunities for diversified farming. With the elevation of 4,000 feet, no fogs, abundance of mountain water running by gravity, a disintegrated granite soil, having been washed from the mountains for centuries, a growing condition is created, the results of which are almost unbelievable.

Alfalfa, as high as four tons to the cutting; timothy with 10-inch heads; from 350 to 500 bushels of potatoes to the acre; as fine Spitzenberg and Winesap apples as grow in Washington and Oregon; a hog, cattle and poultry country that we believe is superior to anything in the State, and, on top of this, the most delightful climate and wonderful scenery.

Surely any farmer figuring on making a change should at least investigate Owens Valley before deciding. Buying a farm is buying a home, and it may be that you will spend the rest of your days on the next farm you buy. Certainly it is worth very serious thought. We want to mail you booklets and pictures, which will tell you a complete story of Owens Valley. The James R. H. Wagner Co., 329 S. Hill St., Los Angeles. Room 10.

40 Acres, near Dinuba, Tulare County, ¼ mile from Southern Pacific, 3 miles from Santa Fe, within 3 miles of three towns; all dry. Accredited high school, telephone, rural delivery. First-class soil, level and under irrigation in best and cheapest irrigation district in this state. Water right with land. Produced 14 tons dried peaches and 25 tons raisins in 1910. 2 acres variety fruits and nuts, over 100 varieties. 2 acres pasture. Plastered cottage, large tank house with 3 finished rooms. Excellent water piped to house and barn. Work shop, fruit, poultry and wood houses. Fully equipped for fruit drying with trays, boxes, transfer fruit car and steel track throughout. Everything about place in first-class shape. $1500 worth personal property. Everything goes with ranch, including furniture. Price $14,000. For terms address owner, Chas. F. Collins, Dinuba, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $120 per acre; your crops pay for the land. Rich level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

Dairy Ranch For Sale—160 acres in San Joaquin Valley; 7-room house, stable, fenced and cross-fenced. Plenty of flowing water to irrigate the 160 acres. 80 acres in alfalfa, balance alfalfa land 12 miles from R. R. Good roads. $100 per acre, ½ cash. Will also sell the cows if desired. Inquire of Geo. W. Berry, of Berry's Market, Whittier, Cal.

For Sale or Trade—230 acres Oregon land in the famous "Rogue River Valley;" fine fruit land, 40 acres cleared, balance in timber; located ten miles from Central Point. A good two-story farm house, large barn. Fenced with 17-wire "Page Fence." Schoolhouse on corner. Would exchange for Los Angeles country or city property to value of $8,000 or $10,000. Price $6 per acre. Address J. H. Grace, Central Point, Ore. P. O. Box 203.

200 Acres Good Level Land—13 A. orchard, shade trees; 12-room house; 2 barns, windmill and tank house; fruit houses, cream separator; engine; etc. Price $21,000. 12 A. orchard home, good house, 4 rooms and bath, barn, fruit houses, windmill, equipment; complete place. $3600. Yolo & Solano Counties. Wyatt & Wilson, Winters, Cal.

20 Acres, adjoining the Roeding and Woo Nursery land, 1½ miles S.E. of Exeter best of soil, good location; fine for orange or lemons. Pumping water at shallow depth, road on both sides, high schoo Price $175 per acre, $2000 cash, balance and 3 years, interest 7 per cent net. Fre M. Hart, Exeter, Cal.

FARM LANDS FOR SALE.

For Sale—15 acres good land, perfectly level, 2½ miles N.E. of Orange, near foothills. Fine location on main street. 15 shares water stock in Santa Ana Valley Irrigation Co. Cement pipe to place. 1000 Eureka lemon trees ready for setting. Price $500 per acre, $4000 cash, balance to suit at 7 per cent. No trade. Call or write S. P. Harriss, Orange, Cal.

For sale—80 acres of land, four miles south of Hanford in the heart of the dairy belt, nearly all in alfalfa. Good buildings, fences and water rights. All checked and leveled. Telephone and rural mail delivery. Address Frank McClellan, Hanford, Cal.

Pacific Coast Lands—Farm lands appraised for prospective investors. Reports on agricultural projects, soils, irrigation, drainage, etc. Paul Goodloe, 1049 Phelan Bldg., San Francisco, Cal.

For Sale—48 acres, all in alfalfa, good buildings, fenced and cross-fenced under the ditch; ¾ of a mile from Newman; $300 per acre. Box 133, Newman, Cal.

For Sale—7-acre general fruit ranch near Los Angeles on new boulevard. W. C. Showalter, Downey, Cal.

Eighty acres finest eucalyptus land, 4 miles from Santa Maria, Santa Barbara County, about one mile from railroad; price $2000, if sold at once. A. Frederiksen, Arroyo Grande, Cal.

Farms for rent or sale on crop payments. J. Mulhall, Sioux City, Ia.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

FARM LANDS FOR SALE.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

HORTICULTURAL PRINTING

So perish all, whose breast ne'er learned to glow,
For others' good, or melt at other's woe.
—Pope.

General Household Notes

A HAMMOCK EPISODE.

Marian, with her "once-in-a-while,"
On a summer evening sat,
In a hammock, while he held her hand,
Now what do you think of that?

He stroked her cheek in a gentle way
And caressed her home-grown hair,
Then he kissed her lips that were plump and red,
Little thinking that she'd care.

But she was a most peculiar girl,
Just imagine his surprise,
When she cried: "How dare you, sir," with grief,
While the teardrops filled her eyes.

She tried to tear herself away,
But his wrist was cramped, I guess;
So he held her fast in a vice-like grip
For a moment—more or less.

"I don't like you any more," said she.
Now just think of language, such.
When he kissed away her tears, she said:
"But I like you just as much."
—Chas. H. Meiers.

SINGLE LIFE.

"Single life is all very well for a while," said the young married man. "A fellow who has always been used to a bachelor existence—going around with the boys and all that sort of thing—after he's been married for a while begins to ache for a little freedom. I don't mean to say that he isn't free just because he's got a wife, you understand?"

"Certainly not," agreed his elderly friend. "We all understand that."

"And it's good for him to have it," continued the young married man, seriously. "You know I think that most married couples stay together too much of the time. It's a good thing for a woman to take a little vacation once in a while and let her husband kick up his heels a little if he wants to. It gives him time to realize that she is necessary to his happiness; perhaps it gives her time to realize that he is kind of handy to have around, too, eh?"

"I think at times they do regard us as a convenience," said the elderly friend. "Your wife's away?"

"Yes," replied the young married man, with a sigh. "She's away and I think it about time she was getting back if you ask me. I didn't mind it at first. When she wanted to know if I'd mind her going to see her mother I told her certainly I didn't. Her mother was sick, you know. It wasn't anything serious, but she felt a little nervous about her, the wife did. So I told her to go along by all means. Well, I went to the theater the first night with Jimmy Burdon and Phil Thomas. Had a bully good time, too, and a nice little supper afterward. Well, sir, I enjoyed it. But somehow it's got so that it sort of palls on me. By the way, the service here isn't what it used to be, nor the cooking either for that matter. All of the restaurants seem to be running down. I believe I'm losing flesh."

"I hadn't noticed it," said his friend.

"Well, I don't mind that so much, but I'm getting a trifle lonesome by this time. The boys are all right and they've certainly done their best to give me a good time, but their idea of a good time isn't mine. I'm afraid Phil drinks a little more than is good for him. Jimmy, too."

"Poor, besotted wretches!"

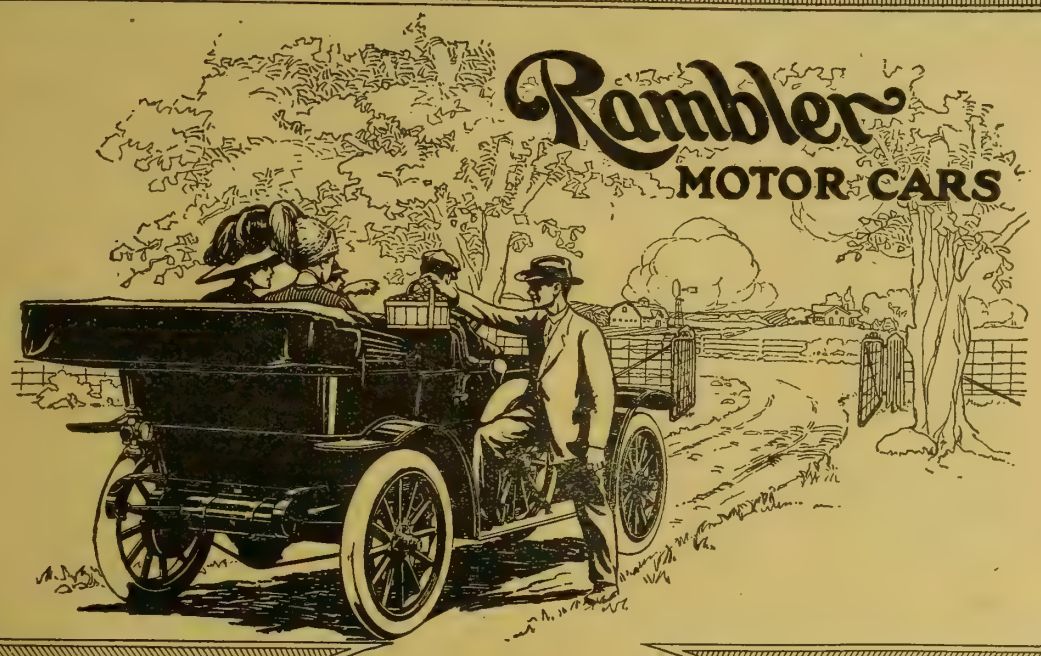
"Yes, they talk about bachelor freedom. Well, that's all right. I can enjoy it, too, about as well as anybody. A man doesn't want to stick at home too closely. He gets narrowed in a way. You know there are some little things—. Well, when I first got home the other night after my wife left it seemed rather good to be able to do just as I wanted to without interfering with anybody else's comfort. But it got old pretty soon. I'm thinking of going to a hotel tonight. When I open a closet door and see her gowns hanging around and the pins and things on her dressing table and realize that she isn't anywhere around and not likely to be for a while it naturally makes a man feel lonesome."

"She isn't coming back for a while?"

"Well, she wired me to say that she would be home tomorrow evening. But something may happen to keep her longer."

"How long do you say she's been gone?"

"She's been gone three days now," said the young married man.—Chicago Daily News.



Rambler
Sixty-five

Forty-inch
Wheels

THE woman on the farm is no longer denied the advantages of the town, but may combine with them the pleasures of living in the country. In the Rambler she may skip away for half an hour any time during the day, do an errand at the store or visit a neighbor. On Sunday morning she can go to church, arriving just as fresh and with as much comfort as the woman living in town. One of the boys or girls can take her in, leave her to do her shopping and return later in the day. She will come home refreshed instead of wearied. The Rambler is the safest, most comfortable car for women and so easy to operate and to start. There is an air of good taste and refinement about it. Big wheels and tires, long wheel base, shock absorbers, fine upholstering, and tonneau foot rest make it as comfortable as a carriage and you feel as safe as in a low phaeton. No need to worry about tire trouble with the Spare Wheel. A clean and durable aluminum front floor with every part protected against dirt—no fear of soiling the most delicate gown. The Rambler is the standard car for the farmer and these features are essential for service on country roads. Experience will prove that they are not mere talking points.

The new catalog is ready—send for it. Ask also for the Farm Owners' Number of the Rambler Magazine. A postal, giving your name and address, will bring these books free.

SEEING ABOUT AN AUTO.

By Oscar E. Youmans.

"I think I'll buy an automobile," remarked Jenkins to his wife, as he sat reading his paper one night after supper. "We might as well be like other folk. I know lots of people who own autos who are not as well off as we are. How do you suppose they manage it?" and he looked inquiringly at his wife.

"How should I know?" returned his better half, who, to tell the truth, was far from being auto crazy. "But how could you get an auto? All our funds are tied up at present."

"Oh, that part doesn't worry me in the least," replied Jenkins. "You forget, perhaps, that Jones' mortgage comes due next week. He told me this morning that he was prepared to pay it. One ought to get a pretty good car for two thousand dollars."

"Yes, but in my opinion the money could be put to a better purpose," she retorted, taking up some fancy work, evidently wishing to dismiss the subject.

"I don't think so," responded Jenkins. "We might as well enjoy a little luxury and pleasure in this life; we'll be dead long enough."

"As for that matter," returned his wife, with a toss of her head, "if you're foolish enough to carry out your idea, it won't be long before we're both dead."

"Nevertheless, I intend to see about an auto tomorrow," replied Jenkins, decisively. "I shall have a good many trial rides, anyway, even if I don't decide to get a car. That experience will be worth something;" and evidently considering the matter settled, Jenkins again took up his paper and settled himself comfortably in his easy chair.

* * * * * * *

"I came to inspect your cars," Jenkins said, entering the automobile shop.

"Certainly, sir," answered the obliging manager. "I'll call a chauffeur and he can take you out for a trial spin in one of our latest models," and he touched a bell.

Now Jenkins had seen all sorts of chauffeurs, but none like the one who answered the bell had ever before crossed his line of vision. He had on a bright green suit, while his trousers were tucked into bright red boots, reaching almost to his thighs. His hands and arms were encased in bright yellow gauntlets, reaching almost to his shoulders. On his head was a policeman's helmet, fiery red, surmounted by a plume of long green feathers. His eyes were protected by goggles of a yellowish hue.

"Come with me," said this gaudily-dressed individual, leading Jenkins to a waiting car.

The car was all right, at least so Jenkins thought, only it looked more like a cross between an omnibus and a moving van than an automobile. Getting into the machine, Jenkins sank down on the soft cushions. Down, down he went; he was about to cry out, when he finally stopped, nearly up to his chin. The cushions fitted about his form, holding him fast.

"That's our patent clutch," explained the chauffeur in a strange, faint voice, that sounded to Jenkins as if it came over a telephone. "Once in its clutch, it is impossible to get loose."

Jenkins agreed with him. The chauffeur than went around to the front of the car, where he took hold of a handle that resembled one on a meat grinder, and commenced to wind up the machine. After turning long enough to have ground at least ten pounds of steak, there came a whirring rattle, followed by several loud explosions. Jenkins looked around, expecting to see a regiment of soldiers; instead, the chauffeur sprang into the car, threw over a dozen or two levers, and the machine started off.

Jenkins watched the chauffeur as he grasped the wheel, and, with a few vigorous turns, deftly swung the auto around a corner. He only collided with a lamppost in the operation.

"Ha! Ha!" laughed the chauffeur, without once glancing back to see what damage had been done. "That is only the beginning!"

If that was only the beginning, Jenkins was far from being elated over the prospect. But he had other things to think about. He was astonished to find that he no longer rested up to his chin among the cushions. Instead, he found himself perched upon a high stool much resembling a piano stool, that slowly but surely turned on a pivot, and necessarily he turned with it.

You are now using our patent revolving, sight-seeing stool," explained the chauffeur, seeing Jenkins' wondering look. "That attachment you'll not find on any other make of machine."

Jenkins was glad to learn that, mentally resolving that some other make of machine would receive his time and attention, if he was lucky enough to land on terra firma once more. The next moment he was startled by seeing a trolley car bearing down upon them. The auto was going at such a terrific rate of speed that a collision seemed certain. But the chauffeur made no attempt to stop the car when Jenkins frantically called his attention to the approaching peril.

Should there be a collision, what a fall he would have from that high stool, thought Jenkins. Horrors! Desperately he clung to the stool, but with a soft, mushy sound they passed right through the car. There was no shock at all.

"You have just observed the workings of our patent jar absorber," the chauffeur explained in the same far-away voice. "With it in good working order, it is possible to pass through anything."

Jenkins relaxed his grip, the danger being past. What a wonderful auto it was! He must surely have one. At that moment they topped a long hill. To Jenkins' astonished eyes, the wheels of the auto flattened out, under the magic touch of the chauffeur, a stream of oil shot out of two pipes that projected in front of the auto, and upon this greased path the car slid down the hill at a terrific pace.

"That's our patent sliding-gear," explained the chauffeur. "No other machine has it."

Jenkins didn't blame the other machines for not including the wonderful patent in their make-up. On his high, revolving stool he swayed dizzily. True, he could see a good deal of the surrounding country, but he would gladly have sacrificed that to get nearer the earth.

At last the bottom of the hill was reached, and the auto reduced its speed. Jenkins noticed that they were far out in the country. Finally the chauffeur stopped the car. Then, touching a button, the high, revolving stool upon which Jenkins sat slid noisily down, and Jenkins was allowed to alight.

"You are now about to witness one

of the most remarkable inventions of auto construction," said the chauffeur. "This one invention puts this machine in a class by itself."

Jenkins' eyes opened wide. The possibilities of that auto seemed limitless.

"You'll notice that all the tires are bursted," went on the chauffeur, in his faraway voice. "Now, look sharp"—and he pushed four buttons simultaneously. Instantly every old tire disappeared and a new one appeared in its place.

"Our invisible tire-changing device," explained the chauffeur, when Jenkins had somewhat recovered. "But, come, we must be on our way."

Jenkins once more entered the car. The chauffeur again manipulated the meat grinder in front. Several loud reports followed, and the machine once more was in motion.

After a few minutes Jenkins noticed that they were approaching a large body of water. There was no bridge. He called the chauffeur's attention to the danger ahead, but the latter only smiled.

"I will now show you our patented non-sinkable device," and, touching a spring, four air-tight rubber cushions shot out under the car, while small paddles appeared beside the wheels. Under this power the auto skimmed over the water like a duck. Jenkins was somewhat disappointed that the car didn't turn into a full-rigged ship.

"We will now start for home," announced the chauffeur, when they finally reached the shore, and the car had again resumed its normal appearance. "How do you like it? Don't you want one of these machines?"

"Yes," answered Jenkins. "It's just what I've been looking for."

"You'll be the first man to own one of these wonderful cars," went on the chauffeur. "They have just been put on the market. They certainly have some wonderful improvements, don't you think so?"

Jenkins did. He also knew he would never forget them, either. He was also glad they were going home. The road was straight, but far ahead Jenkins saw that a large red barn obstructed the road. He asked the chauffeur if he saw it, but received no answer. On, on they rushed, never slackening up.

"I've left this, our grandest and most wonderful invention, for the last," explained the chauffeur. "Our patented disappearing wings will now appear, enabling us to clear that obstruction easily," and, under his magic touch, wings sprang out on both sides of the car. Under their powerful force the auto rose gracefully in the air. It had almost reached the top of the barn when something went wrong. The car turned several graceful handsprings, finally reaching the ground with a fearful thud.

That car's career was ended then and there. When Jenkins came to he found himself on the grass, unable to move. The chauffeur and another man stood over him.

"Is he hurt much, doctor?" the chauffeur asked.

"No, not much. He only has both arms and legs broken. I can soon fix him up," and taking a saw from his instrument case, he began to saw away upon Jenkins' leg. Poor Jenkins was powerless to resist. There, one leg was off, and the doctor tossed it aside like a piece of wood. With a chuckle he began on the other, when—

* * * * * *

"Wake up, Henry!" cried his wife at that moment, giving him a vigorous shake. "Do you think you can sleep there all night? You must have been having a frightful dream by the way you've been carrying on. It's past ten o'clock."

Jenkins rubbed his eyes sleepily, but was overjoyed to find that it had only been a dream after all. "I don't think I'll buy an auto, after all," he declared, as he started up the stairs. —Country Gentleman.

THOSE PUZZLING SHOE NUMBERS

We have always believed that those puzzling numbers were invented for the confusion of customers who insist that they take a certain size, whether it fits or not. We do not know of any other reason, but we find that when we ask for our accustomed size we are fitted without trouble, even though the number marked in the shoe looks like the license number of an automobile. It is quite safe to order shoes by the old numbers, as the new numbers are merely synonymous for them; the shoe dealer knows what is meant, and so long as they fit, the obscurity of the new numbers does not matter. Of course there is sometimes difficulty in fitting where there is a great change in model of last, and we sometimes find that slippers and ties, especially, are more comfortable when one size longer and one width narrower than the accustomed size is selected. Indeed, short shoes are always both uncomfortable and disfiguring. We would keep on ordering by the old numbers, and let the seller struggle with the new ones. Rural New Yorker.

Don't crowd; the world is large enough
For you as well as me;
The doors of all are open wide—
The realm of thought is free.
—Charles Dickens.

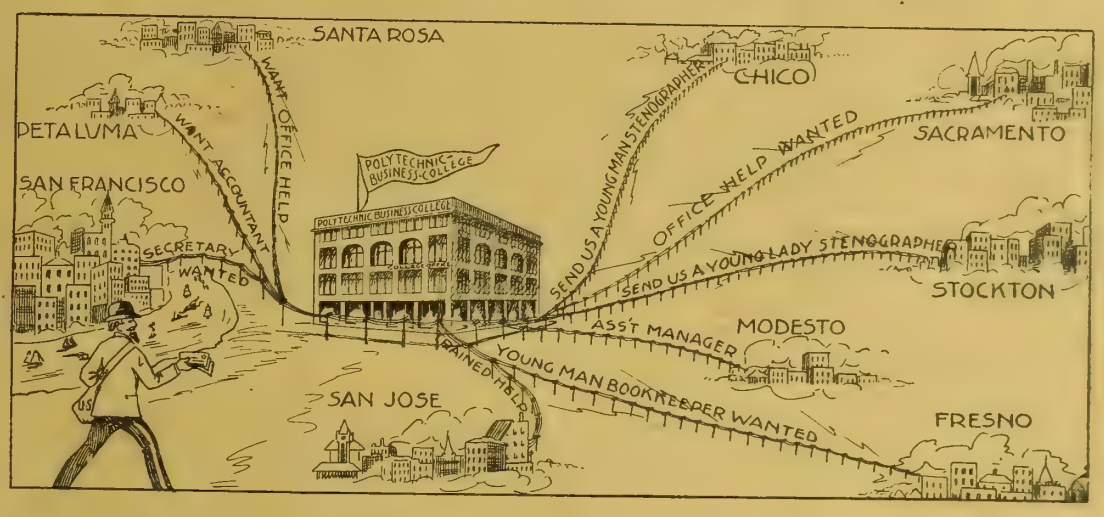
—We Have the Calls—



Positions!

This call comes from every city in Northern California. It comes by mail, telephone and telegraph. There is a constant demand for efficient office help. Our reputation is state wide. When trained help is wanted, business men naturally think of the Polytechnic Business College of Oakland. We give the most complete training to be had in the West. Our school is a great office in which the actual forms and methods of business are in daily practice. The complete course includes bookkeeping, stenography, typewriting, commercial law, spelling, arithmetic, penmanship, letter writing, etc. This course gives a complete mastery of every business requirement.

Positions!!

For YOU, young man and woman, there is a great opportunity awaiting. A ready ability to meet requirements means a value upon your services which is well paid for. There is a demand for trained assistants. The opportunities are many, and you can fit yourself for a good position. Advancement is rapid for the trained mind.

We want five hundred students to fit themselves for the positions which are waiting to be filled. Will you be one of the number? Will you fit yourself for a good position, or will you be content to be a laggard in the affairs of the business world? That is a question for each one to decide for himself. The sensible young man and woman will decide to prepare himself or herself for a real career and genuine success.

Positions!!!

We want to send you one of our catalogues. It gives full information concerning the course, the school and the opportunities which await every ambitious student. Out of town students are supplied with suitable convenient and wholesome accommodations at reasonable rates.

Get in touch with us. We can be of great benefit to you.

ALREADY OUT OF COMMISSION.

The front door bell was out of repair. Mother in a hurry instructed John to put up some sort of a notice to that effect, so that the visiting public would be notified. John is long on football and short on the mysteries of punctuation. He finally evolved this sign, which a startled neighbor brought in to the mother: "Please Knock the Door Bell Out of Order."—Woman's Home Companion.

San Francisco Market

SAN FRANCISCO, May 2, 1911.

Butter.

Hay.

Scott, Magner and Miller say:

Receipts of hay for the past week amount to 2,299 tons, practically the same as last week. The market in this city continues along about the same. There has been fair inquiry on the market, although trade about town, we think, is lighter than we have ever seen it before, and if the receipts were any larger it would be almost impossible to move them.

Even with the advanced figures in the country, we note several sales in the past week which have been made at prices on a higher basis than the San Francisco market, which would indicate that the purchasers expect a raise in the market shortly. There has practically been no export trade during the week, and very little demand for alfalfa, as stock is feeding off grass.

Fancy wheat	13.00@13.50

Citrus Fruit Market

LOS ANGELES, May 3, 1911.

There are not as many Navels on trees to ship as last year this date. This situation is rather of a surprise to all excepting those who have kept in closest touch with conditions. Still better, the prices being received are remarkably good. At this moment extra choice Navels are commanding $3.00 to $3.10 f. o. b. East. Seedlings, Mikes and other than Navels are also being well received; a few Valencias are occasionally going forward, but the promise of more satisfactory prices later will hold these up. It now appears that Navels will be cleaned up prior to June 1.

The number of Mediterranean lemons afloat and on the New York piers is little more than half that of last year. In addition, the quality of the imported bears no comparison to the California stock. Liberal cuttings of fruit are being made constantly, and the promise is for a fairly heavy picking so as to reach market at about the right time to command best prices. Of course there is some danger that low-grade stuff from the Mediterranean, damaged by the cold spell, may come in, but that situation is so generally understood that it is not thought the market will be affected.

Shipments.

Shipments of oranges to date since November 1, 1910, 23,745; lemons, 2,926; total, 26,671. To same date last season: Oranges, 16,042; lemons, 2,253; total, 18,295.

Business

THE RIGHT REMEDY AT THE RIGHT TIME.

A little knowledge of the horse, his ordinary diseases and ailments and remedies to be applied, may be of valuable assistance to many of our readers.

A little book, "A Treatise on the Horse and His Diseases," contains an index of diseases, which gives the symptoms, cause, and what is said to be the best treatment of each and will be sent free to any of our readers. It is published by the Dr. B. J. Kendall Company, Enosburg Falls, Vermont, the makers of Kendall's Spavin Cure.

It is well to be prepared to apply the right remedy at the right time, and when in doubt to be guided by the satisfactory experience of others.

SPRING TRADE GOOD.

Inquiry among the Los Angeles agricultural implement dealers elicits the information that spring trade is in full swing. Good sales of Deering Mowers have been made during the last two weeks, one purchaser, the Cudahy Ranch Co., having more than duplicated their orders of last season for these high-grade machines, according to Mr. F. W. King, of Hawley, King & Co.

This firm also reports much interest being shown just now in the "Flour City" Gasoline Traction Engines and the Southwick Hay Presses, their new hay press and engine catalogues being in demand, and prospects being bright for many sales in the near future.

Scientific Methods of Irrigating Orchards

By Samuel Fortier, Chief of Irrigation Investigations,
U. S. Department of Agriculture

Care and good judgment should be exercised in the selection of an orchard tract. If it turns out well the profits are high, but if it fails the losses are heavy. It involves the setting aside of good land, the use of irrigation water, and somewhat heavy expense in purchasing trees, setting them out and caring for them until they begin to bear.

Assuming that the climate and soil of the district selected are adapted to the kind of trees to be grown, the next important things to consider are good drainage and freedom from early and late frosts. Low-lying lands under a new irrigation system should be regarded with suspicion, even if the sub-soil be quite dry at the time of planting. The results of a few years of heavy and careless irrigation on the higher lands adjacent may render the low lands unfit for orchards. On the other hand, the higher lands are not always well drained naturally. A bank of clay extending across a slope may intercept percolating water and raise it near the surface. Favored locations for orchards in the mountain states are often found in the narrow river valleys at the mouths of canyons. The coarse soil of these deltas, the steep slopes and the daily occurrence of winds, which blow first out of the canyons and then back into them, afford excellent conditions for the production of highly flavored fruits at the minimum risk of being injured by frost.

Proper exposure is another important factor. In the warmer regions of the West and Southwest a northern exposure is sometimes best, but as a rule the orchards of the West require warmth and sunshine, and a southerly exposure is usually most desirable. Natural barriers frequently intercept the sweep of cold, destructive winds, and when these are lacking windbreaks may be planted to serve the same purpose. Depressions or sheltered coves should be avoided if the cold air has a tendency to collect in them, a free circulation of air being necessary to drive away frost. The low-lying lands seem to be the most subject to cold, stagnant air.

While experience has shown that the orchard trees of nearly all kinds can be successfully grown on soils that differ widely in their mechanical and chemical composition it has also shown that certain types of soils are best adapted to particular kinds of trees. Thus the best peach, almond, apricot and olive orchards of the West are found on the lighter or sandier loams; the best apple, cherry and pear orchards on heavier loams, while walnut, prune and orange orchards do best on medium grades of soil. The requirements of all, however, are a deep, rich and well-drained soil.

Formerly most Western orchards were supplied with water through earthen ditches. These leaky, unsightly channels, by reason of their cheapness, would have been quite generally retained had it not been for the increasing value and scarcity of water. The value of water for irrigation purposes has increased beyond the average of that given by the census report of 1902 over 300 per cent. In many localities there is likewise great scarcity at certain times. These rapidly changing conditions have induced many water companies to save some of their heavy losses in conveying water supplies by substituting pipes for open ditches in earth, or else by making the ditches water tight by an impervious lining.

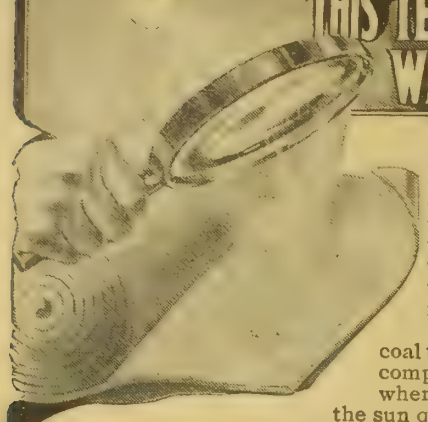
The high value and scarcity of the water in natural streams have likewise induced orchardists to install pumping plants to raise water from underground sources. It was estimated that in 1909 20,000 of these plants were in operation in California alone. In other parts of the West reservoirs are being built to supplement the late summer flow of streams which fail to provide enough water for all.

The few typical examples which follow may not only give the reader an idea of how orchards are supplied with water, but also indicate the customary division into tracts to serve this and other purposes.

The Lewiston Basin is located where Clearwater River flows into the Snake River in Western Idaho, and varies from 700 to 1900 feet above sea level. A few years ago water was brought from neighboring creeks and stored in a reservoir. The water required for orchard irrigation is conducted from this reservoir under pressure in two lines of redwood stave pipes over the rolling hills which separate the reservoir from the orchard lands. On these lands contour lines were first established, and each quarter section was afterwards divided into forty-acre tracts by sixty-foot streets. These were further subdivided into eight five-acre tracts, with a twenty-foot alley through the center. The large conduits from the reservoir are connected to smaller lateral pipes laid in the alleys, and these in turn are tapped by three-inch pipes, which furnish water to the five-acre tracts.

The town of Corona, California, is hemmed in on all sides by lemon and orange orchards. The chief water supply for these groves comes from Perris Basin, forty miles distant. The Temescal Water Company owns 3600 acres of water-bearing lands in this basin, and at favorable points pumping plants have been installed. These plants are operated by motors supplied with current from a central generating station located at Ethenac. The discharge from each pump is measured over a rectangular wier having an automatic register. Device is shown in Figure 1. Small lined channels convey the water from the pumps-

Irrigating From Cement Flume in Los Angeles County. —Courtesy L. A. Chamber of Commerce.



THIS TEST REVEALS THE HIDDEN WEAKNESS IN ROOFINGS

All ready roofings—except J-M Asbestos (stone) Roofing—are made of so-called felt composed of animal or vegetable fibres. When these fibres were growing, they lived upon the ground or animal from whence they came, and received their life therefrom. So every fibre of this nature is hollow, like a straw.

These felts are water-proofed with coal tar, asphalt and oil, or other volatile compositions which quickly evaporate when the sun reaches them. Therefore, the sun quickly begins its deadly work of taking these oils off the surface of such roofings; and then continues to draw them out of the inside through the strawlike fibres of which the felt is composed, until the roofing becomes dry and porous and is no longer water-proof.

J-M Asbestos Roofing is unlike other roofings, because its felts are made of stone fibres which are *solid*. These *solid* stone fibres defy the action of the sun's rays and positively prevent capillary attraction, thus hermetically sealing all of the oils so they must remain to do their duty indefinitely.

J-M ASBESTOS ROOFING

is not merely *one* sheet of water-proofed stone felt, but *several* layers cemented together with nature's wonderful water-proofer—Trinidad Lake Asphalt. This asphalt is also hermetically sealed, making any escape of oils or asphalt impossible.

Prove for yourself that sun will soon destroy the water-proof quality of ordinary roofings. Focus the rays of the sun through an ordinary sun or magnifying glass and note results. This, in ten minutes, will show you what sun will do in a few months.

This simple sun-glass test is as severe in its way as our famous blow-torch *fire* test. It will show up the short-comings of a roofing *before* you pay out your money.

Because of its stone nature, J-M Asbestos Roofing also never needs painting, and is fire-proof, acid-proof, rust-proof and rot-proof.

Most hardware and lumber dealers sell J-M Asbestos Roofing. Sold direct, and applied if desired, where we have no dealer. Write our nearest Branch to-day for sample of the curious Asbestos rock from which this roofing is made, and our handsomely illustrated Book No. N 55

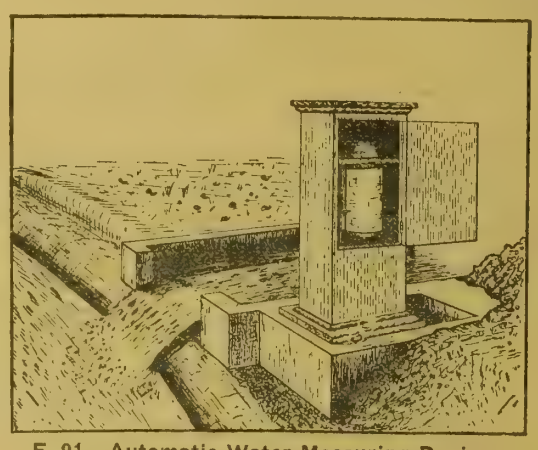
to the main conduit. The concrete lining of this conduit is composed of one part cement to seven parts sand and gravel, having a thickness on the slopes of two and one-half inches and on the bottom of three to four inches. The lining is rendered still more impervious by the addition of a plaster coat one-fourth of an inch in thickness, composed of one part of cement to two parts of sand. The cost was five and one-half cents per square foot, or fifty-five cents per linear foot. The main conduit consists of about thirty miles of lined canal and ten miles of piping thirty inches in diameter. The groves are laid out as a rule in ten-acre tracts, and piping of various kinds conveys the water from the main to the highest point of each tract, from which it is distributed between the rows in furrows.

A large part of the water used by the Riverside Water Company is pumped from the gravelly bed of the Santa Ana River. From thence it is conveyed in a main canal to the orchard lands and distributed to the groves in cement and vitrified clay pipes. The owner of a tract, whether it be ten, twenty, thirty or forty acres



F. 91. Automatic Water Measuring Device.

in extent, receives his supply at the highest corner through a hydrant box. Each hydrant box not only allows the water to pass from the end of a lateral pipe to the head flume of the tract to be irrigated, but also measures the amount in miner's inches under a four-inch pressure head as it passes through.

On the Gage canal system in Riverside, California, the water supply for the tiers of forty-acre tracts is taken from the canal in riveted steel pipes, varying from six to ten inches in diameter. These larger mains are connected with four, five and six-inch lateral pipes of the same material, which convey the water to the highest point of each ten-acre tract.

As a rule fruit trees are planted on land previously cultivated and cropped. One of the best preparatory crops for orchards is alfalfa. This vigorous plant breaks up the soil and sub-soil by its roots, collects and stores valuable plant foods, and when it is turned under at the end of the second or third year leaves the soil in much better condition for the retention of moisture and the growth of young trees.

In recent years large areas of wooded lands in both the Hood River and Rogue River Valleys of Oregon have been cleared in order to plant apple trees. One of the methods employed in the Hood River district to rid the land of its growth of fir, pine, scrub oak and laurel is by boring into stumps or trees and burning. Another method consists in splitting open the stumps with giant powder and then pulling out the roots with a stump puller. Stump pullers of various kinds are used in California for a like purpose.

An effort should be made to establish a fairly uniform grade from top to bottom of each tract. This is done by cutting off the high points and depositing the earth thus obtained in the depressions. The length of the furrows should not exceed one-eighth of a mile, and in sandy soil they should be shorter. As a rule it is not difficult to grade the surface of an orchard so that small streams of water will readily flow in furrows from top to bottom.

In setting out orchards which are to be irrigated the elevation of the surface of the ground should first be ascertained. This is usually done by making a contour survey by which each tract is divided into a number of curved strips or belts by level lines. With these as a guide the direction of the tree rows can readily be determined. Where the trees are watered in basins or checks flat slopes are not so objectionable, but in furrow irrigation a slope of about two inches to the one hundred feet is necessary to insure an even distribution of water. When streams are to be run in the furrows the slope of the furrows may be increased to eight, ten and even to twelve inches to the 100 feet. On slopes varying from ten to forty feet to the mile the tree rows may, therefore, be located at the proper distance apart down the steepest slope. Under such conditions the trees are most commonly planted in squares. The location of the trees can be best fixed by the use of a surveyor's transit and steel tape. When these are not available a woven wire cable about three-sixteenths of an inch in diameter will answer the purpose. If apple trees are to be set out, and it is desired to have them thirty-two feet apart tags are inserted between the strands of the cable to mark this exact distance. A base line at the proper distance from the fence or one margin of the field is then laid down and long sighting stakes driven at each tag. The corner is then turned and a similar line is laid out. This process is continued until the location of the trees around each of the four sides of the tract has been fixed. The corners can best be turned with a 100-foot tape or link chain. First measure from the end of the base line a distance of thirty feet. Hold the one hundred end of the chain at this point, and the ten-foot link at the corner; take the tape or chain at the fifty-foot mark or link and pull both lines taut. A stake driven at this vertex will establish a point on a line at right angles to the first. When stakes have been set on all four sides the intermediate locations for the trees can readily be ascertained by sighting between corresponding marginal stakes.

Where the slope is steep and difficulties are likely to be encountered in distributing water the equilateral, hexagonal or septuple method of planting, as it is variously termed, should be adopted. It will be observed that in this method the ground is divided up into equilateral triangles, with a tree at each vertex. The trees likewise form hexagons, and when one includes the center tree at each hexagon they form groups of sevens.

The chief advantage of this mode of planting in irrigated districts is that it provides three, and often four, different directions in which furrows may be run. Having the choice of so many it is not difficult to select one which is best for any particular tract. The ground can likewise be cultivated in more ways, and about one-seventh more trees can be planted to a given area than is possible in the square method.

In the past the trees of irrigated orchards have been planted too close. This is made clear to even the casual observer who visits the old orange groves of Riverside, California, the deciduous orchards of the Santa Clara Valley, California, or the apple orchards of the Hood River district in Oregon. Under irrigation systems peach trees should be spaced twenty to twenty-two feet; olive, pear, apricot and cherry trees from twenty-two to twenty-eight and thirty feet, orange trees twenty-two to twenty-four feet, apple trees thirty to thirty-six feet and walnut trees from forty-eight to fifty-six feet apart.

On the Pacific Coast the tendency toward wide spacing has induced many growers to insert peach fillers between other slower maturing trees, such as the apple and walnut.

The usual way of irrigating orchards is by means of furrows. These vary in depth, length and distance apart, but this diversity does not tend to create different kinds of furrow irrigation. The division of this subject is rather due to the means employed in distributing the water from the supply ditch to the furrows. In some cases the distribution is effected by making openings in an earthen ditch, in others by inserting wooden or iron spouts in the ditch banks, while in many others flumes having the desired number of openings, or pipes with standpipes, divide the supply among the requisite number of furrows.

Permanent ditches at the head of orchard tracts should be located by a surveyor. The proper grade depends chiefly on the soil. If the soil is loose and easily eroded a slow velocity is best. On the other hand, the velocity must be sufficiently rapid to prevent the deposition of silt and the growth of water plants. In ordinary soils a grade of two and one-half inches to one hundred feet for a ditch carrying two cubic feet per second is not far out of the way. The amount of water to be carried varies from one-half to two or more cubic feet per second. A ditch having a bottom width of twenty-four inches, a depth of six inches and sloping sides ought to carry one and one-half cubic feet per second on a grade of half an inch to the rod, or three inches to one hundred feet. Such a ditch may be built by first plowing four furrows and then removing the loose earth either with shovels or a narrow scraper. Canvas dams, metal tappoons or other similar devices are inserted in the head ditch to raise the surface of the water opposite that part of the orchard where furrows have been made, and which is about to be watered. The chief difficulty in this mode of furrow irrigation arises in withdrawing water from the ditch and in distributing it equally among a large number of furrows. A skillful irrigator may adjust the size and depth of the ditch bank openings so as to secure a somewhat uniform flow in the furrows, but constant attention is required in order to maintain it. If the water is permitted to flow for a short time unattended the distribution is likely to become unequal. Parts of the ditch bank become soft, and, as the water rushes through, the earth is washed away, permitting larger discharges and lowering the general level of the water in the ditch so that other openings may have no discharge. Some of the orchardists of San Diego, California, insert in niches cut in the bank pieces of old grain sacks or tent cloth. The water flows over these without eroding the earth. Another device is to use a board pointed at the lower end and containing a narrow opening or slot, through which the water passes to the furrow. Shingles are also used to regulate the flow in the furrows. The thin ends of these are stuck into the ground at the heads of furrows.

In recent years short tubes or spouts have been used in many of the head ditches of orchards to divert small quantities of water to furrows. These tubes are usually made of wood, but pipes made of clay, black iron, galvanized iron and tin are occasionally used.

For nurseries, and young trees especially, and also for mature trees, a cheap and serviceable tube may be made from pine lath, such as are used for plastering. The four-foot lengths are cut into two equal parts and four of these pieces are nailed together to form a tube. One of these tubes, when placed with its center two inches below the surface of the water in the head ditch, discharges nearly three-quarters of a miner's inch of water. In some of the deciduous orchards of California a still larger wooden tube or box is used. It is made of four pieces of three-quarter by three and three-quarter inch redwood boards of the desired length. The flow through this tube is regulated by a cheap gate, consisting of a piece of galvanized iron fastened by means of a leather washer and a wire nail.

In making use of tubes of various kinds to distribute water to furrows it is necessary to maintain a constant head in the supply ditch. This is done by inserting checks at regular distances. These distances vary with the grade of the ditch, but 150 feet is not far from being an average spacing. In temporary ditches the canvas dam is perhaps the best check, but in permanent ditches it pays to use wood or concrete. In this the opening is controlled by a flashboard, which may be adjusted so as to hold the water at any desired height and at the same time permit the surplus to flow over the top to feed the next lower set of furrows.

Formerly head flumes for orchards were built of wood, but the steady increase in the price of lumber and the decrease in the price of Portland cement have induced many fruit growers to use cement instead.

A head flume composed of cement, sand and gravel costs, as a rule, about twice as much as a wooden flume of the same capacity, but the early decay of wood, especially if it comes in

Where Ranching is a Cinch

Canvas Irrigating Hose

This hose is not intended for heavy work, but where level ground, or a slight fall prevails, even though the surface be uneven and the soil loose, water may be delivered with little or no loss. It is light, easily handled and easily taken care of. Made in two grades: First, of 20 oz. duck, sewn with heavy linen cord; Second, of 12 oz. duck, strongly made. Our Coated Hose does not mildew, therefore lasts longer. Either the Plain or Coated is good for several seasons with reasonable care. Sizes: 1½, 2½, 4, 6, 9 and 13 inches in diameter. **Write for Price List.**

contact with earth, makes the cement flume cheaper in the end.

For large head flumes and laterals many fruit growers first carefully prepare an earthen ditch which has carried water for at least one season and afterwards line the inner surface with cement concrete.

Head flumes, being placed on the surface of the ground, interfere with the free passage of teams in cultivating, irrigating and harvesting the crop. Dead leaves from shade and fruit trees also clog the small openings in the flumes. These and other objections to flumes have induced many fruit growers of Southern California to convey the water in underground pipes and distribute it through standpipes placed at the heads of the rows of trees. Both cement and clay pipes are used for this purpose.

The former are usually molded in two-foot lengths, with beveled lap joints, and consist of a one to three or one to four mixture of cement and fine gravel and sand. The most common sizes are six, eight, ten and twelve inches in diameter, having a thickness of shell in the twelve-inch pipe of one and one-half inches, which is reduced to a trifle more than one inch in the six-inch pipe. Piping of this kind, when well made and carefully laid, will withstand a head of ten to sixteen feet. The clay pipe is similar to that used in cities for sewers and, having stronger joints, withstands a greater pressure, but costs more. A line of pipe is laid about two feet below the surface from the feed main and measuring box across the top of the orchard, and as each row of trees is passed a standpipe is inserted. Various devices are employed to convey the water from the pipe to the surface of the ground at the head of each tree row and divide it up evenly among four to six furrows. One of the most common consists of a series of standpipes, the top of each set rising to the same elevation. At each change of elevation special standpipes are used, and in these are inserted gates provided with overflows. Occasionally a high pressure pipe is substituted for cement and clay.

The length of the furrow is often governed by the size of the orchard. The rows of citrus trees seldom exceed forty rods in length, but the apple orchards of the Northwest are larger as a rule. Even in large tracts it is doubtful if it ever pays to run water in furrows more than about 600 feet. Where the soil is open and water sinks readily through it short furrows should be used, otherwise much water is lost in deep percolation on the upper part of the tract.

The grade of furrows varies quite widely. In flat valleys it is often not possible to obtain a fall greater than one inch to 100 feet, while on steep slopes the fall may reach twenty inches per 100 feet. On ordinary soils a grade of three to four inches is to be preferred, and where the fall exceeds eight to ten inches to 100 feet the trees should be set out in such a way as to decrease the slope of the furrows.

The furrowing implement most commonly used by the orchardists of Orange County, California, consists of a sulky frame, to which are attached two or three double mold-board plows. Those who prefer a small number of deep furrows use a twelve to fourteen-inch corn lister. The space between the furrows is four and one-half feet and the depth is regulated by the lever arm of the cultivator.

Paine's Pruning Method

We have a letter from Mr. Chas. R. Paine of Crafton in which he refers to a report in the Redlands Facts of an address by Dean Wickson in which Mr. Paine's methods of pruning are referred to as the "opening of the outer wall of foliage" by the removal of the older and somewhat useless portions of the side branches. That is established usage in pruning and will never lose its value, for, as long as life in the tree is active, it is necessary to rid it of the old parts that room may be made for the new.

Mr. Paine's method includes the additional feature of opening the top of the tree by cutting out upright central limbs or branches of the upper side limbs that overhang the middle portion of the tree.

The work looks destructive at first view, but when the results appear from giving, for a long period, the opportunity for a rich and lively growth, all along both good and poor branches, the owner is satisfied that the work was not wasteful. The main part of such work need not be repeated, because the weight of branches and fruit serves to continue the opening; thereafter, only the too vigorous growth tending to close the top opening needs to be kept down.

The method is of great value in trees that are weak and poor from any cause, and of special value in trees that are decadent. This is so because, in all such trees, terminal growth is crowded because of its quantity and poorly nourished in all its parts, for the same reason; this is indicated by small, yellowish leaves and by dead twigs and wood throughout the tree. Such a state of the tree leaves unused a large store of plant food, gathered during its previous life, existing in trunk and limb; whereas the top opening, by always affording free access of the energy of light and free circulation of air, from which half of the plant food material is derived, gives opportunity for abundant growth of fruit wood, chiefly, and revives all parts, save the exhausted end twigs, which ultimately should be cut off.

The total absence of dead wood, the vivid green of the new inside foliage as contrasted with that outside, the tendency of this new growth to fruitfulness of high quality and the rarity of sucker growth, unite to convince the man who has practiced the method of its value and importance.

Recently thirty-two hours of work by men wholly inexperienced fully prepared three hundred and ten good-sized orange trees for renewing life, and little more than six minutes of time was used on each tree; in side limb pruning—always a useful process—a man in nine hours ordinarily prunes from ten to fifteen trees. The latter method is seen to be much more expensive and is far from being as beneficial, and may be neglected if the open top method is practiced.

Because this is the season to experiment or to proceed to make a regular use, as some have, of this method, now proven to be so effective and economical, is the reason many have visited Mr. Paine's orchard and are making a test of the merits of his pruning methods in their own groves this spring.

California Likfresh Company

WM. H. SWETT, Pres.

Growers, Packers and Canners:

You cannot afford to continue drying by present methods, whether sun-drying or evaporating. You are under unnecessary expense—Your cured fruits and vegetables are costing you more than you need to pay.

Premium stock can be made by Likfreshing the fruit that reaches your cannery a little too ripe for successful handling with your present equipment.

The Likfresh process is not only less expensive, but it does the work in less time.

The advantages of Likfresh do not end with economy of production.

LIKFRESHED FRUITS AND VEGETABLES are not merely "dried". They are "like fresh", as the name indicates.

For example, Likfreshed peaches or apricots soaked in cold water, then eaten with sugar and cream, will taste as if just picked from the tree. Apple sauce made of Likfreshed apples, has the flavor, firmness, and appearance of sauce made from the fresh article. Likfreshed roasting ears, cabbage, string-beans, cauliflower, pumpkin, squash, rhubarb, strawberries, loganberries, raspberries, etc., will have the appearance, flavor and in every way resemble the fresh article when cooked.

This means higher prices for your cured products. Cheaper production and higher prices mean more profits for you.

Inquiries have been received from all over United States and Canada, asking for samples and information as to where the product can be bought in large quantities. The market is ready—it is time for you to make ready to supply the demand.

We install your plant for you ready to run. We build the first fire, test the machine and teach you to run it. In short, turn the plant over to you in perfect running order and under your control.

Every fruit man should see the Likfreshing machine in operation. You are invited to visit our demonstrating plant at Berkeley, bring something with you and watch it put through, bring as much as you like.

BUT BY ALL MEANS SEE IT, IT MAY MEAN A BIG SAVING TO YOU THIS SEASON.

For further information, samples of product, etc., address:

Irrigating Texas Oranges

From the Citrus Fruit Grower of Texas we note the following regarding the irrigation of oranges in that state:

Flooding.

This system of irrigation is recommended only for soils to be newly planted with some crop—it is a very rapid way to get water over the land. The irrigator has to work in the water and has to use all his strength and speed to help the water reach all points, which however, it never does in equal volume. Flooding is adapted to lands that will take water rapidly and where the run is short; the land level and the borders high enough to hold sufficient quantity of water for vertical percolation.

Check System.

This is a modification, and is a great improvement, of the flooding system—it is really flooding. By the use of ridges or levees thrown up 6 to 12 inches in height; the size of the checks can be made 6 to 12 feet square, depending on the size of the trees to be watered; if the trees are very large all the land in the orchard can be checked off so that all the spaces between the trees can be irrigated; this method makes it possible to know that a certain amount of water has actually been applied, because it is easy to see the depth of water which stood in the enclosure; it also enables the irrigator to quickly spread a considerable depth of water over the surface, and facilitates the use of a large run of water in a very short time.

The Furrow System.

The small furrow system is the best. The furrows are made with a single plow, or several plows attached to a frame—from four to twelve plows can be used. The plows are set about one foot apart on the frame; one or two good sized wheels can be set a few feet apart in front on a shaft ahead of the plows to steady and regulate the depth. It is important that the land should have equal areas and that the surface should be free from depressions to prevent the water from collecting until it rises above the furrows and running together in a pond; the furrows should run on a very light grade through the orchard, which allows the water to soak in better; the furrows can be run on the contour lines or at right angles. On hill sides and heavy slopes or where there is considerable drop, flumes should be used from one level to another; these are made from steel pipe, terra cotta pipe, concrete or lumber, with gates or check valves at different intervals to regulate the flow of water.

Remarkable Area Mapped

The United States Geological Survey's topographic map of the Mount Lyell quadrangle, California, which was recently brought up to date by field surveys has just been reprinted. It shows a fine piece of mapping of a remarkable part of the High Sierra. The area mapped affords one of the best illustrations of the old lowland plain which, uplifted in early geologic time, now forms the crest of the Sierra in California to the west and south of Mount Dana and Kuna and Koip peaks. The quadrangle contains a portion of the famous Mono Lake, which is about 15 miles in diameter. This lake has no outlet and lies in a beautiful mountain valley where there are perhaps 20,000 acres of volcanic land that under irrigation will yield large crops of alfalfa, grass, and other products. To the west and southwest extends the great backbone of the Sierra with a multitude of peaks which tower to heights of 10,000, 11,000 12,000, 13,000 feet, and even higher. South of the lake are the Mono craters, once active volcanoes, and one or more similar craters are probably covered by the lake itself.

Water Power Streams.

Tuolumne, Merced and San Joaquin rivers head in this high mountain region. The Tuolumne flows through the beautiful Hetch Hetchy Valley and the Merced through the more famous Yosemite Valley in the Yosemite National Park. On all these streams there are splendid water powers; indeed the Tuolumne and the San Joaquin, whose waters merge in the region of the northwest of the Mount Lyell quadrangle, have probably as great if not greater possibilities for the development of water power than any other two streams in California. Portions of the Mono and Sierra national forests are included in this area.

The fine forest area on the west slope of the mountains is one of the most striking examples of beautiful rugged mountain country west of the Sierra divide, where there is abundant verdure and ample water power. Immediately to the east, in Pumice Valley and around Mono Lake, is the border of the great Nevada desert. Looking down upon this desert country and upon Mono Lake is Mount Dana 13,050 feet in height, the descent from its peak to Mono Lake, a distance of 8 miles, being 7638 feet.

Glaciers and Trout Streams.

Many examples of fine glacial sculpturing are seen in the Mount Lyell quadrangle and the region abounds in large and small glacial lakes and streams which are alive with trout of many varieties. A number of picturesque glaciers contribute to the water supply.

Lyell Canyon, heading on Mount Lyell at an altitude of 13,090 feet, is a splendid U-shaped glaciated canyon, the original V-shaped gorge having been scoured and ground out into its present form by the irresistible forces of the ice flow. In the southern portion of the quadrangle is the Devil's Post Pile, a great mass of basaltic columns rightfully regarded as one of the natural wonders of the Sierra. In the vicinity of Iron Mountain and the Minarets is a highly mineralized section in which gold, silver, copper, and iron show good prospects.

The quadrangle is traversed by many trails and some good roads, which are frequented each year by mountain-loving tourists. In 1909 the state built a road from Leevining

Creek to the Tioga road, leading to Tioga Lake, making a through route across the mountains. This road opens easy communication from the entire Nevada desert country, including the Mono Lake, Tonopah, Goldfield, Death Valley, and Owens River regions, through to the coast. The only other available wagon roads are those over Sonora Pass, 50 miles to the north, and Walker Pass, 200 miles to the south.

The Mount Lyell map is sold by the Geological Survey at Washington at the nominal price of 5 cents. A portion of the quadrangle is included in the area shown on the Yosemite National Park administrative map, the pocket edition of which, bound in covers, is sold at 35 cents singly, or 21 cents each if at least fifteen are purchased.

Irrigating the Fig Tree

By G. P. Rixford.

Among our deciduous fruit trees the fig is conspicuous in thriving vigorously over a large portion of California without irrigation, while in the hot, dry valleys it flourishes with a moderate quantity of water, applied for a short time only. This is what would naturally be expected considering the prevailing arid conditions of its early habitat in the old world. The tree has been cultivated from the earliest historic times over a broad belt commencing in eastern Persia and extending through Arabia and Egypt and along both shores of the Mediterranean as far as the Azores Islands.

In the drier portions of the great valley of the state water in early summer is indispensable. A successful Symrna fig grower on the eastern side of the San Joaquin Valley conceived the idea that his crop would be improved by withholding water entirely. So last summer he gave his forty-acre orchard of eight-year-old trees, planted on red clay loam, no water whatever. The result was a light crop of undersize figs.

In the central San Joaquin Valley where the Smyrna fig industry has its greatest development, the tree requires some irrigation in early summer to keep it in vigorous growth and to produce large fruit, but should not be watered after August 1st. Many growers never irrigate after June 1st and others stop at the time of caprification in June, but the time for withholding water is regulated somewhat by the weather and the character of the soil on which the trees are planted. The reason for stopping irrigation in midsummer is to allow the new growth to ripen and be better prepared to endure the winter frosts. The succulent growth of the fig tree is very sensitive and if kept pushing by continual applications of water until the hard frosts occur, the tree will suffer severely. Trees seven or eight feet high in this condition are sometimes killed to the ground, while if the wood is well hardened it will endure without injury a temperature of twelve to fourteen degrees of frost.

Each irrigation should be followed by cultivation and the last time by the disk or other tool that will leave a mellow surface upon which the ripe and partially dried figs may fall.

Some Fundamentals

By J. B. Neff.

Before beginning irrigation we should know something about the movement of water in the soil and the amount necessary to produce a given crop. Prof. King of Wisconsin has spent much time in making experiments to determine the amount of water used in the growth of plants and has concluded that it requires from 300 tons to as much as 750 tons of water to produce a ton of dry matter, and this in addition to the moisture that goes off from the ground without passing through the leaves of the plants. Since it is not possible to prevent some evaporation from the ground it will be seen that a quantity largely in excess of this is required. Enough water to cover an acre one inch deep will weigh about 113 tons, so that if there is to be one ton of hay grown on an acre there must be from three acre-inches to five acre-inches of water applied at the proper time in excess of that wasted by evaporation. The amount required by trees is not so readily determined, but the soil must be kept continually moist and it has been found that in order to have the best results in localities where there is an average of fifteen inches of rainfall, and when good cultivation is done to prevent excessive evaporation, from twelve to fifteen acre-inches of irrigation water is necessary to carry a walnut orchard fifteen years old through the summer. About five acre-inches is needed for oranges and from five to ten inches more for lemons.

The free water which forms the visible liquid layers on the soil grains or occurs between them is pulled down by gravity and eventually goes out into the country drainage if there is an excessive amount of water applied. The water which is held by the soil particles against the force of gravity is called capillary water. This cannot be seen as liquid water, but may be recognized by its effect on the color of the soil. It is free to move in any direction and it is from this water that cultivated plants and trees get most of the water necessary to their growth.

There is no fixed rule as to the time of irrigation nor the amount to be applied at one irrigation, but it must be borne in mind that water enough must be applied to thoroughly moisten all the soil of the orchard to a depth of five feet and that all the water that goes more than two feet below the feeding roots is likely to be lost and to take with it some of the soluble fertilizers of the soil.

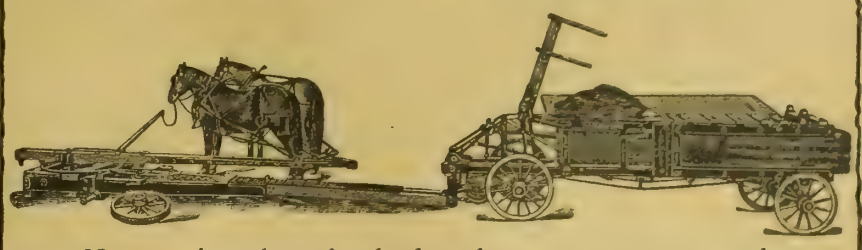
Water that is applied in furrows will not usually percolate sideways more than 18 inches from the furrow, so in order to moisten all the ground the furrows must not be more than three feet apart. A common practice is to make four to six furrows between

FAST-WORKING

SOUTHWICK

TWO-HORSE SELF-FEED

HAY PRESS



No question about it, the best horse power press made. Note its good points—great capacity, perfect bales, ease of operation, durability, full 40-inch feed opening, long bale chamber, low bridge, self-feed, stands on the wheels when in use. A perfect press, and a money maker.

Get your order in to us quickly, as it will soon be too late to secure them in time for this season's baling.

We also have the Sandwich Engine-power Belt Presses—splendid machines of wonderful capacity; also smaller presses—all-steel, self-feed.

Here is one of the many testimonials which have been given us:

Colegrove, Cal., April 17, 1909.

Hawley, King & Co.,
Los Angeles, Cal.

Gentlemen:

I have worked on a Southwick horse-power press for twelve consecutive seasons, and now own one which I bought from you two years ago. I have baled as high as 40 tons in one day. On one occasion we baled 20 tons before noon, and last season I averaged 32 tons per day for the entire season's run, during which time I baled 2060 tons of all kinds of hay. I would not have any other kind of Hay Press.

Yours very truly,
P. BERGON.

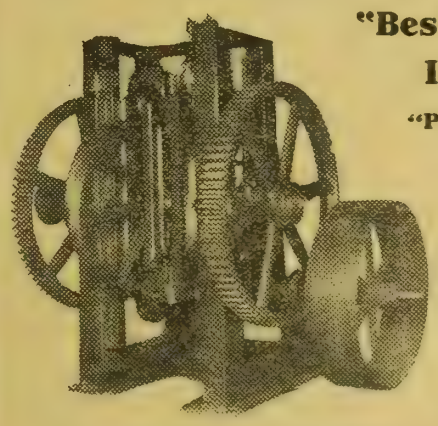
"The LUITWIELER Non Pulsating System"

"Best for Deep Well and Irrigation Work"



"PUMP TALK CONTINUED:"

"Luitwieler pumps are a finished product and come to you ready for immediate service. No babbitting or other machine work has to be done in the field. No pit is required."

"Luitwieler pumps are equipped with adjustable sliding bases for quick handling over the well. Pump may be removed in a few minutes. Also note that it does not require the services of a skilled mechanic to take apart and put together again when replacing leathers on the plungers."

"Luitwieler pumps apply the power uniformly and do not break rods. We guarantee absolutely against rod breakage. We also guarantee the least power consumption of any pressure pumping method. We further guarantee our cams and rollers against ever wearing out. No time limit."

"There is a reason for our success. Our pumps are most economical and most durable. Give us a trial to be convinced by your own experience. Established 1877.

LUITWIELER PUMPING ENGINE CO.

LOS ANGELES

the tree rows, leaving a space of six to twelve feet in the tree row without furrows. In such cases there will be a space of several feet in width which is too dry to furnish plant food and is of no benefit to the owner during the dry season.

When furrows are used to distribute water they should be as deep as can be conveniently made and should not be so long that the water will go too deeply at the upper end of the orchard before it is sufficiently deep at the lower end. This can be avoided by making more head ditches and shorter runs. If basins are used a certain amount can be run into the basin the opening stopped and the water allowed to stand until it enters the soil.

The only sure way of determining where the water is going is to dig short trenches across the furrows about 24 hours after the water has stopped running, or to dig a number of holes, and in this way see how much of the soil is moistened. Soil that is moist to the depth of four feet at that time will be sufficiently moist and will not have any excess of water that will go below the feeding roots of which fully ninetenths are within four feet of the surface.

Irrigation of Covina Valley

By Ben F. Thorpe, Covina.

The irrigation of the Covina valley is provided for by the Covina Irrigation company and the Azusa Irrigation company. Both of these companies are incorporated, and their stock is held by the owners of land in the district. Water stock in the Azusa Irrigation Company is appurtenant to the land, three shares belonging to each acre in the district. They have a fine system of pipe lines which take the water of the San Gabriel river above Azusa, and thence conduct it to the stockholders of the company. Their territory extends from Azusa on the north to the Covina city limits on the south, and west to the lower end of Irwindale. This company is noted for having the best system of pipe lines, and distributing boxes with measuring gates, of any district in Southern California.

The Covina Irrigation Company is a stock company, and also takes its water from the San Gabriel river near Azusa. Its lines extend east to Charter Oak, and south to the Baldwin ranch, and they have a good system of pipe lines for distributing the water to the users, and large reservoirs for storage of water, near the town. Both of these companies own large wells and pumping plants, as an auxiliary supply when the river water is insufficient, and these two sources give Covina one of the best water supplies of the citrus belt in Southern California.

Methods of irrigating the orchards vary. In the localities where the soil is heavy, the furrow system is extensively used; other growers use the zig zag system, which is used by the majority, and in some of the lighter soils the basin system is used to good advantage. The orchards are irrigated about every thirty days during the summer months. Japanese labor does most of the work.

On the lands south of Covina on the Baldwin ranch the irrigating is done by means of pumping plants which furnish a good supply of water, and have made possible the planting of hundreds of acres to orchards that were formerly used to grow hay and grain, and have worked a transformation in this locality.

COMING BULLETIN.

The United States Department of Agriculture will shortly issue a report entitled "Irrigation in San Joaquin Valley, California," by V. M. Cone, which is available for free distribution as long as the supply lasts, on application to U. S. Irrigation Investigations, Berkeley, Cal.

This report gives an account of the physical and industrial conditions in San Joaquin Valley and describes present irrigation on each of the present streams of the valley. There are over 7,000,000 acres of land in the floor of San Joaquin Valley, of which about two-thirds are irrigable, and more than a million acres now irrigated.

In connection with previous irrigation bulletins issued by the United States Department of Agriculture, this report provides a fairly complete statement of the irrigation conditions and problems of this important part of California.

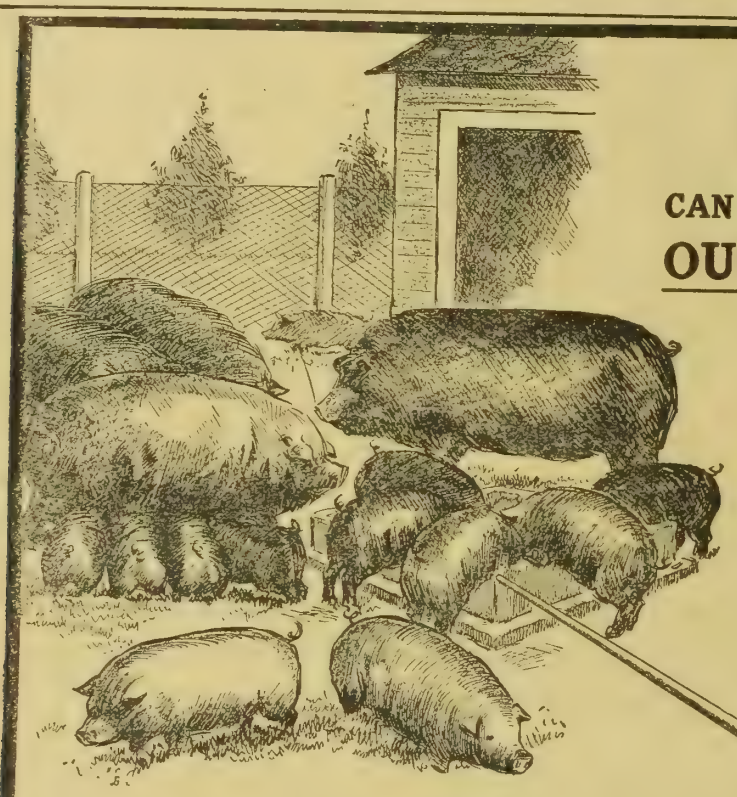
WAY TO MEASURE WATER.

The quantity of water running in a large or small stream or in a ditch can be measured very simply without the use of a weir, if an approximation of the flow will suit the purpose. First secure the mean velocity in feet per minute by throwing a floating body such as a straight straw or thin stick of wood into the center of the stream, where, of course, the water is flowing the fastest. The stick should be thrown some distance above the point to be measured, so that by the time it gets down it will have acquired the velocity of the water. Measure off fifteen or twenty feet, and take the time consumed by the stick in going this distance. This velocity is much more than the mean velocity of the stream. In fact, take 83 per cent of this velocity as the average. Next secure the cross section by getting the average depth, which can be found by measuring the depth in a number of places at equal distances across the stream, adding them together and dividing by the number of measurements taken. This will give the average depth, which should be multiplied by the width of the stream at the surface for the cross section. Thus if it is found that the float traveled twenty feet in ten seconds, then the stream is flowing two feet per second. If you desire to be more exact, take 83 per cent of this velocity. Then multiply by the cross section and you will have the cubic feet per second.—Exchange.

One Colorado inch equals 17,000 gallons in twenty-four hours.

One second-foot equals 59½ acre-feet in thirty days.

One million gallons equal 3.069 acre-feet.



PIGS

CAN BE RAISED CHEAPER ON

OUR SMALL FARMS

In the SACRAMENTO VALLEY

CALIFORNIA

than in any other known section of the United States. This fact is due to the large quantities of alfalfa that can be grown here and the even temperature, which makes it possible for pigs to forage in the field every month in the year.

Packing houses in Sacramento and San Francisco will contract for all the hogs you can raise—the market is always short on hogs, and good prices prevail.

Hog raising is one of the most profitable industries in the Sacramento Valley, owing to the long growing season, the mild winters and the bountiful yield of alfalfa and grain.

A good stand of alfalfa, a year old, will support from 12 to 25 hogs on an acre throughout the year. Good sows will average 5 to 6 pigs each litter and will bear twice a year. In from 10 to 12 months' time, a hog raised on alfalfa alone should weigh from 200 to 250 pounds. Hogs meet with a ready sale at from 5 to 8 cents a pound. A little figuring will show you the possibilities of 20 to 40 acres of alfalfa one year old stocked with hogs. Stock can be raised from birth to maturity "without a shiver."

You can purchase one of these small farms on very liberal terms—

$15 DOWN THAT'S ALL **$11 A YEAR** THAT'S EASY

By making this small cash payment any man who is willing to work will win; every month in the year he can produce from this fertile soil some article of food that can be converted into immediate cash.

The market is waiting for your products—no matter what it may be—your success depends upon your own efforts, with no limit to your possibilities.

There is a charm to the life of a Sacramento Valley farmer; work is a pleasure out in the open air. He is king of his own little kingdom. In acres he knows that

"TWENTY'S PLENTY—FORTY'S A FORTUNE"

The Sacramento Valley Irrigation Company will sell you from 20 to 80 acres of their great project on very easy terms. $15 an acre as a first payment and the balance spread over ten years—$125 an acre in all. Ten years to make good. Could you ask for a better opportunity to meet success face to face? Write today for full information.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE NECESSITY OF LIBERAL FEEDING.

Not long since an Eastern gentleman was looking over the Hoard's Dairyman herd. He remarked to us that he had rarely seen so many two-year-old Guernsey heifers in milk that showed the same size and vigor, and he asked us to explain how it was done.

We replied that the only explanation we could make was that it was a settled policy on our farm to feed and nourish the young heifers well from calfhood up. Also that having an abundance of alfalfa hay, that of itself was a great aid to such a result. We have often observed in these columns that a good cow was either made or unmade in the first two years of her life. This question should occupy the attention of dairy farmers more than it does. Dr. Hopkins, in his book, "The Story of the Soil," states the question well as follows:

"As a matter of fact there is a time in the life of the young mother, as with the two-year-old cow, for example, when she must abstract from the food she consumes sufficient phosphorus for the nourishment of three growing animals—her own immature body, a suckling calf, and another calf as yet unborn."

Now, phosphorus, or phosphate as it is ordinarily termed, is one of the principal elements of nutrition to both plants and animals. We can only get a true understanding of these things by a study of the scientific side of farming. Any man of average intelligence can absorb such knowledge if he will but read and study on those subjects. Then he begins to understand what true farming means. When he hears or reads about nitrogen, or protein as it is sometimes called, and phosphate, and potassium, or potash as it is more generally called, he does not turn aside and say "no book farming for me."

The true farmer provides himself with books and papers that contain such reading. He nourishes his mind just as he knows his soil and his animals must be nourished. What a difference there is between farmers in this respect! You will see here and there one with a well-nourished, well-stored mind; others with half-starved minds; and their soils and animals show the effect of this mental nourishent or starvation in either case.—Hoard's.

KEEP THE COLT UP.

Nearly everyone aims to give his brood mares about a week's rest after foaling, but on few farms are sufficient horses kept so that they can be allowed a longer period of rest than this.

When the mare is again put into the fields, shall the colt be allowed to follow the mare, or kept in the barn?

The latter is the better plan in many ways. If the foal is allowed to follow its mother to the field, to trudge after her all day long, it will be completely tired out long before the day's work is ended.

It is also in danger of being injured in various ways. It would be far better off left at the barn, in a lot, or, if the weather is bad, in a box stall, where it can do itself no harm.

After the first day the colt will cease to be restless, and will become perfectly contented as soon as its mother is taken out of its sight.

Also, under this plan, the mare will work as well as usual, after the first day or two, which would not be the case if the colt were in the field where she could keep it in sight most of the time.

The first week, of course, it will be necessary to unhitch the mare in the middle of the forenoon, and again in the middle of the afternoon, and take her to the barn and allow the colt to suck, but this is not one-half as inconvenient as having the colt in the field to get in the way and to keep its mother in a flutter of excitement. It will not be long before the colt can be left away from its mother half a day at a time, and then the mare can be worked without any inconvenience whatever.

If there are two or more colts, put them in a lot together when their mothers go to the fields, and they will be more contented.

When there is any necessity of having the brood mare away from home all day, the colt should be haltered to her side. If on the road, there will then be no danger of the colt running back, or up branch roads, or following other mares.

Haltering the colt to the mare is a particularly wise precaution when a trip is to be made to town, or anywhere where railroads have tracks to be crossed.—Journal of Agriculture.

COWPOX.

Place the affected cow by herself or at end of row of cows in stable and milk last or have her milked by one who does not come in contact with the other cows. The disease is contagious and spread by the medium of the milker's hands. Twice daily bathe the udder with a solution of half an ounce of hyposulphite of soda in a quart of water and paint the sores with glycerite of tannin as often as found necessary. Let the milker wash his hands in a similar solution and after milking each cow.—Farmer and Stockman.

HIGHEST IN TWENTY-NINE YEARS

The Thirty-ninth annual report of the Elgin board of trade shows that the average price for butter for the year 1910 was the highest that it has been in twenty-nine years. The average price was 29.8 cents. In 1882 the average price was 33 2-3 cents, the lowest average price was in 1896 when it was 17.8 cents.—Hoard's Dairyman.

Writing of general conditions in Sacramento County, Mr. H. L. Murphy, owner of the Brighton herd of Shorthorns at Perkins, says that his little advertisement in the Cultivator brought him many letters and has resulted in much business. On the fruit situation he says the outlook is good. Farmers are all cutting alfalfa now and there is a fine yield. A recent sale of grade dairy cows of over 70 head, averaged $100 per head, one selling at $210.

The Brighton herd has just been increased by a bunch of fine registered Berkshires of over 50 head brought in from the East. They are all of the best breed, one September pig topping the scales at 225 pounds. This fellow cost $150. Mr. Murphy predicts "The largest showing of Berkshires at the next state fair ever known."

COTTONSEED MEAL FOR HOGS.

Many of the experiment stations in the north and the agricultural press and others have sounded a warning in regard to the danger in feeding cottonseed meal to hogs in the usual way of feeding, but it has been found by practical experiments, that it can be fed safely to hogs according to directions given below, and that it is one of the cheapest grain foods that can be furnished at present prices, taking into consideration the nigh per cent of protein carried by it.

Make a mixture in bulk, about one-third cottonseed meal and two-thirds corn chops, whole corn, wheat bran, or shorts; mix with water to a thin mush in two vessels (an old barrel sawed in two is good), and leave to sour or ferment, which will take from twelve to forty-eight hours, according to the weather and other conditions; then feed from these alternately, using the contents of the one while that of the other is left to sour.

A good growing ration may be based on one pound of dry mixture per hundred pounds of live weight. For quick fattening this may be doubled, quadrupled, or even more largely increased. Indeed, the Texas Experiment Station fed as much as seven and a half pounds per day to 150-pound hogs, though this is extreme and uneconomical, if not positively dangerous.

When ready to feed add fresh water to the feeding ration sufficient to bring to a thin slop, about the consistency of sweet milk, and give the hogs all they will clean up.

All hogs eat it greedily and all thrive on it from the lordly head of the herd, to the tiniest grunter. But for "piggy" or suckling sows it is especially valuable, giving to the pigs, both before and after farrowing, a growth and vigor attainable with no other feed on earth.

In an experience of over twenty-five years I have never seen a hog refuse to eat it, or injured by it. Indeed, it is not only the best and cheapest feed on earth, but it is an efficient prophylactic and hogs fed on it seem entirely immune to many of the common ills that hogs are heir to.

As to feeding value of cottonseed meal compared with corn, chemical analysis, confirmed by years of practical tests, answer thus: A hundred pounds of corn contains from six to ten pounds of protein, four to six pounds of fat and about sixty-five to seventy pounds of carbohydrates. A hundred pounds of cottonseed meal contains from forty-five to fifty pounds of protein, from eight to twelve pounds of fat and about twenty-five pounds of carbohydrates.

The agricultural experiment stations and the agricultural text books, all teach us these things:

First. To feed a balanced ration.

Second. That a balanced ration is one in which the three important food elements, protein, fat and carbohydrates, are combined in such proportions as to meet the needs of the body in the best way at the lowest cost.

Third. That protein is the most valuable food constituent, supplying growth, muscle, bone and lean meat, and by it the value of all feed is measured.

Fourth. That fat in feeds supplies heat and energy and builds up fat in the body, but makes no muscle or flesh.

Fifth. That under the general term carbohydrates are classed in the starch and sugars present in all feeds, forming the cheapest and most abundant feeding material and, like fat, giving heat and energy, but making no flesh, bone or muscle.

Sixth. That a balanced ration for hogs should contain about one pound of protein to every five pounds of fat and carbohydrates.—American Swineherd.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

LIVE STOCK INVESTIGATIONS.

All experimental work that goes beneath the surface is beset with obstacles in which many sciences are intricately entangled. Every technical problem in agriculture yields both definite and indefinite results under scientific investigation. Not only are the data themselves surcharged with subtle differences, oppositions, interrogations and contradictions, but the attitude and the personality of investigators are factors in the difficult search for truth. It is not improbable that experiments sometimes produce more positive or negative information than can be accurately interpreted by inexperienced students, especially in cases where popular notions or prejudices exert a powerful influence.

It is obvious that scientific investigations in agriculture cannot be conducted or measured by fixed rules; in the maze of conditions which surround every quest for the elusive truth there is much variable groping in dark places even by the most enlightened explorers. But there are types of research work which because of their many-angled complexities require more time for study and yield less popular information than some other lines of inquiry. Perhaps the most difficult of all branches of work in which scientific men are engaged is that which has to do with live stock. In pursuing it they encounter a stubborn combination of all the puzzling physical, chemical and biological conditions which in the field of the narrower specialist are less troublesome.

Americans are too impatient, too insistent on immediate dividends, to give science the time and aid which it requires to dig out fundamental truths in the practically unplowed field of animal husbandry. Serious, competent men no more than begin an investigation than the public clamors for definite results by which it may justify its support of the work. If a prompt response offering revolutionizing finalities is not forthcoming some "practical" legislator moves that financial encouragement of the investigation be withdrawn or decreased. He finds in soil investigations, for example, that their economic value to the state in a few years amounts to infinitely more than their total cost. Using this net result as a standard by which to judge, he finds that live stock investigations have not paid. Moreover, he probably concludes that it is much more important to increase and conserve soil fertility than to find out how farmres may utilize this raw wealth to the best advantage in making meat, milk, wool—and men.

If we are to get anywhere in live stock investigations we must put more money into them, quit prodding experimenters for "facts and figures," and grant science the busy leisure which it demands in its slow, tedious search. And the public should understand that the scientific man who is large enough to make an important nnd in any field of research never announces his discovery with a tom-tom. Beware of the brass-band spirit in all scientific endeavors.——Breeders Gazette.

THE SUPPLY OF BACON MATERIAL

For several months past the underweight hog has been in the center of the market spotlight. The less weight a shote has carried the more clamorous has been the bidding for it. Pigs have sold at an extravagant premium, viewed in the light of market precedent, and bacon-curers have been at their wits' ends securing the raw material they needed. Even the bacon hog of regulation weight has been in most cases a chubby butcher pig, remote in general make-up from the ideal baconer.

For this the abundance of corn has been solely responsible. Despite the premium on underweights, the process of converting corn into pork has been at all times too profitable to warrant the sacrifice of the porcine digestive machinery capable of such a transmutation process, but, like the scarcity of lard hogs a year ago, it is a mere temporary condition and one that furnishes little logic to strengthen the position of the bacon hog specialist. In days of plenty the bacon-curer found abundance of material in that portion of the pig crop culled at a tender age to reduce the farm herd to winter feeding proportions, and the same condition will recur. Hog trade history, like all other brands, repeats at regular intervals, and the time is not far distant when there will be light hogs on the market in abundance, with some to spare.

THE SHROPSHIRE.

A Shropshire fleece is fine in texture, dense, bright, of good length, and with a uniform close crimp. There should be a dense wool covering on the belly and inside the legs as well as on the body because this not only increases weight of fleece, but it is protection from all troubles due to lying on wet ground.

There should be no dark fiber in the fleece and as little as possible on top of the head. Wooling should extend well down on the legs, and in ewes strict femininity must be sought for. It is well to place much stress upon the breeding and the advantages obtained by going to an old flock when making purchases.

Pedigree is simply the record of an animal's ancestors, and a sheep whose sire, dam, grandsire, grandam, great grandsire, great grandam, etc., have been noted sheep with exceptional merit, will surely give better results in the breeding flock than one whose ancestors have been practically unheard of or unknown altogether. Successful breeding of live stock is a life work and the foundation must be laid slowly and well. By founding a flock with judicious selections from the best breeder the greatest factor is achieved —a sure and certain basis upon which to build up a flock of the highest class. Many breeders have never been able to eliminate the results of a bad start with the ewe foundation, despite the fact that they have used high-class rams for many years. The right sort must be selected even if an apparently high price has to be paid. We say apparently because the best specimens of the breed rarely prove to be dear in the long run, while the second-rate ewes are not cheap at any price and may be a constant source of disappointment.—Howard A. Chandler, in Coleman's Rural.

Before you buy a Cream Separator See and try a DE LAVAL

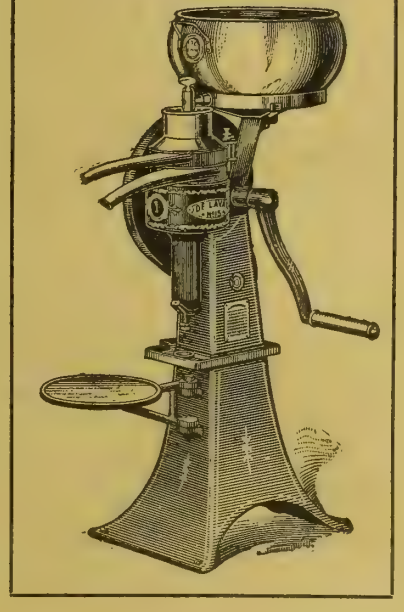
IS THERE ANY DOUBT IN YOUR MIND as to which cream separator will give you the most satisfactory service and be the most economical for you to buy?

Here is a proposition that should interest you.

Ask our nearest agent to bring a DE LAVAL out to your house and set it up for you. (If you don't know the DE LAVAL agent drop us a line and we will give you his name and address.) Try out any other separator you wish alongside of it. Give them both a fair, honest trial. Then buy the machine that

Skims the cleanest, Turns the easiest,
Is easiest to wash, Is best constructed.

If there is any doubt in your mind when you make this test as to the comparative skimming of the two machines, take a sample of skim-milk from each separator and send it to your State Experiment Station. They will tell you which sample contains the most butter-fat.



We sell thousands and thousands of cream separators every year upon just such tests.

We don't hesitate to ask you to make such a test because we know the DE LAVAL will skim cleaner and give you better service than any other machine on the market. That's why we are perfectly willing to let you try it out alongside of any "would-be" competitive machine ever built. Our willingness to have you make such a test should mean more to you than volumes of printed claims.

Give your cows a square deal. Be fair to yourself. If there is any one farm machine that should be of the very best possible construction it is the cream separator. It is used oftener than any piece of farm machinery—730 times a year—and the very best machine that you can buy will be far the cheapest in the end. You have always heard the DE LAVAL spoken of as a high-grade machine. All DE LAVAL users are DE LAVAL "boosters," because it always "makes good."

We have agents in almost every locality who will be glad to set the machine up for you and give you a free trial, and we have an arrangement with our agents whereby a purchaser, if he desires, may make a partial payment at time of purchase, and pay the balance on easy terms covering a period of twelve months.

If you are interested in the purchase of a cream separator, be sure to write for our new catalog which illustrates and describes in detail the features which have made the DE LAVAL the universal favorite among dairymen all over the world.

In writing please address your inquiry to nearest De Laval office.

SHEEP SHEARING.

From a Los Angeles daily we take the following interesting account of a San Diego County sheep shearing:

It is sheep-shearing time at the Bernardo ranch near Escondido, several thousand acres of which is leased by Matt Casou, a cattle and sheep man of the Escondido country, and the scenes so interestingly depicted in Helen Hunt Jackson's novel, "Ramona," during the sheep-shearing time when Alessandro made love to Ramona at Senora Moreno's ranch, are taking place.

The sheep shearing band, numbering fifteen, is composed of Indians from the Rincon Reservation, a few miles northeast of Escondido. Pete Benado takes the character of Alessandro, captain of the sheep shearers, in the real work, his duties being to look after the men and to sweep the stray locks of wool into the fleece piles as the Indians ply the shears. The character of Luigo, the paymaster, is taken by an Indian, the foreman of the Cassou holdings, he being the man who passes out the equivalent of a 5-cent piece to each man as he comes to the table, outside the shearing shed, with his fleece of wool.

In the novel it is related that five minutes was required by the experts of Capt. Alessandro's band for the shearing of a sheep, going to show the truth of Alessandro's contention to the effect that he had a band of the best shearers in San Diego County. Capt. Pete Benado thinks that he has the equal of the Alessandro band, and in truth, some of his men can remove the fleeces at that rate. Fifty, however, is considered a very good day's work. The fleeces which are tied up, two or three fleeces in a bundle, are thrown into a huge sacking bag and made ready for the shipment to market.

In the story as told by Helen Hunt Jackson, the Indians used to work from sunrise to sunset, with only time enough off to eat the midday meal. The Indians at the Bernardo ranch work from sunrise to 5 o'clock in the afternoon. From the larger pens about fifty sheep are driven into a little enclosure near the sheep-shearing brush arbor, these being worked upon until the list of the candidates is exhausted, when another lot is let in. The Indians take their pick of the creatures as soon as they are ushered into the yard, taking, of course, the best in the first onslaught. Gradually the easier ones are eliminated, and toward the last the tough ones are left, causing the work to drag and the men to become impatient. The men, to whose lot falls the drawing of the last three or four sheep, usually get the merry laugh from their fellow shearers.

Like Senora Moreno, Mr. Cassou will have none other but Indians to do his shearing, and as he doesn't have to explain his acts to Juan Can, or any other persons, his wishes carry. Mme. Benado, wife of the captain of the sheep-shearing band, is the cook of the camp, and the Indians live in tents. By Monday night the shearing for this half of the year will be ended and the young and old bucks of the reservation will be wending their way back to the mountains with their pockets full of the coin of the realm, as the result of their three weeks of toil.

CONSERVATION.

The conservation of our natural resources perhaps does not appeal more strongly to Californians than to residents of any other section of the country, but the matter of conservation of watersheds is of such a vital concern that it has been given more general study than in any other section of the United States, unless it be in a small portion of the Appalachians which has suffered such fearful destruction from flood waters as to compel the people to consider how they may be held back in the mountains instead of being poured over the valleys to the vast damage of farm and city. In California the aim is not only to prevent flood damage in winter time but to conserve water for summer use. This is accomplished in several different ways.

The most tangible and immediate results are secured by construction of storage reservoirs on the few natural sites. Amongst these are the Sweetwater in San Diego County, Hemet in Riverside County, and Bear Valley in San Bernardino County.

Another method of holding back flood waters and one which can be followed on all watersheds is the maintaining of a forest or brush growth which prevents rapid run-off of rains. The enemy of this method is the midsummer forest fire. The vast majority of watersheds are only supplied with the covering given by nature, but thousands of acres have been planted to forest growth, and the effort, though often resulting in failure, has proven the possibilities of the work in adding wonderfully to the moisture supply. One section of Southern California has entered into the work by putting up dollar for dollar with the government in planting forest reserves. Many counties up and down the state have also joined with government forces in appointing rangers whose duties are to act with the regular rangers in fire protection. This fire protection is also helped by construction of firebreaks by cutting out along the ridges great lanes 70 to 100 feet in width and often miles in length.

Another step in saving water is taken by the diversion of mountain streams to great areas of gravel lands. This has been done in San Bernardino County to the end that wells and the lower stretches of the Santa Ana River have been kept flowing much later than naturally would have been the case. This method has the objection of being expensive and of being of necessity repeated every year.

Similar to the above is the diversion of flood waters of winter flowing streams directly to the orchards and storing a supply directly where the trees need it. After thorough saturation perfect cultivation enables the trees to have abundance of water until ripening time without any later irrigation.

NEED OF REVISION.

It has been said that "no question relating to irrigation in California or other states approaches in importance the speedy and certain determination of water rights." The laws are in a most unfortunately jumbled condition, though somewhat cleared up by court decisions. The effort has been repeated many times to have California's irrigation laws gathered together and made more perfect in one coherent enactment, but some of the strongest men in the state have feared the result of such effort would be to renew litigation which many years would be required to finally settle. For the owner who has established water rights on which a ruling has been secured this would be cause for concern, for these same owners have spent millions of dollars in litigation to protect their rights in this state. On the other hand, future litigation could be much lessened by enactment of carefully considered legislation. As a general thing, the northern part of the state, where local practice in irrigation has not been so fully established, is more favorable to the proposed change than are irrigators of the south.

In 1878 the legislature passed the first law designed eventually to provide proper public control of water. This was the law that created the office of state engineer, one duty of which is the "acquirement of data upon which the state might formulate a policy and frame legislation respecting irrigation matters." The engineer's first recommendation in 1880 was strongly in favor of revision; in fact, at that time he suggested the advantage of forming irrigation districts, made possible seven years later by the enactment of the Wright act. Other recommendations made have never been acted upon by this state, but have been made the basis of excellent laws in other states.

The next movement looking towards a change of water rights was in 1903, when an exhaustive examination of irrigation conditions was made. This was joined in by the United States Office of Experiment Stations and the Geological Survey. A bill was formulated, and its passage urged, but it was defeated in the legislative committee. This was reintroduced in 1909, but its passage not pressed.

DRAINAGE.

Many California farmers have referred to the fact that the cost of irrigating in California is to a limited extent offset by saving in drainage which is necessary on many eastern farms. This is true on most of the loam and gravel soils of the state, but there are other soils on which drainage is fully as beneficial as on the eastern blue clay. In some sections, especially in portions of the San Joaquin Valley, drainage is absolutely essential. Extended investigations were made there after thousands of acres of vineyards had been destroyed by seepage waters from irrigation canals and a great system of drainage mapped out. Some of these plans have been carried out; more are yet to be completed. This work will probably be done under the act approved March 20, 1903, which makes provision for the formation of districts for the reclamation of agricultural lands "other than swamp and overflowed lands, which are susceptible of one general mode of drainage by the same system of works." The majority of the voters within the boundaries of the district is sufficient to establish such drainage district.

CARELESS CAMPERS.

At the risk of being charged with harping on the same old strain, we must pass on the warning again to every reader of the Cultivator to use greatest caution in the starting of fires in field and on mountainside. All of us feel that fire is the last thing with which we should be careless, but the untold millions of dollars fire loss annually in California, a greater part of which results from carelessness, is proof that we are weak on this line. It is easier to leave a burning campfire than to carry water sufficient from spring or far-away stream to make sure all fire is out. Not only should we be impelled to exercise greatest care because of our interest in the welfare of our state, but because of the good stiff fine to which we are liable. Bear in mind that the fine may be imposed even if the fire has not escaped and done damage; this has been done in many instances. The careless hunter and the smoker, and all others as well, should remember that this is the beginning of the danger period and join in exercising greatest care and in spreading the gospel of fire protection.

READ THE ADVERTISEMENTS.

If you do not read the advertisements in the Cultivator you lose much that tends toward better homes, happier children and a greater revenue. We search the entire state for things that are worth while; for the things that mean advancement, economy and betterment.

The advertisements are intensely interesting. They open the way to greater doing, higher thinking and better living. An advertisement is a commercial introduction. Our advertisers have something of interest to the agricultural poulation and they take the Cultivator as the best means of reaching the well-to-do people of the state. They are reliable merchants and manufacturers. You can save money, get better goods and secure better treatment from Cultivator advertisers than from any other source. Try it and see. When you want something, look through the Cultivator. Perhaps you will find it or an improvement that you had not thought of.

A catalogue is issued by most of our advertisers. The books are interesting and instructive and are sent to any address for the asking.

Commissioner Loeb and other officers of the treasury have visited certain vessels carrying Mediterranean lemons to the port of New York in order to ascertain the percentage of rot, to determine duty. Inspectors have taken about 5 per cent of the cargo and dumped the fruit, and from these ascertained the rot and made allowances. This practice caused the importers to rebel, as they felt the proportion of fruit dumped was too large, as it necessarily sold at low prices. If the importers wish the advantage of the decay reduction, they must be content with proper examination.

The southern berry crop is much less than usual. From Wilmington, North Carolina, up to May 1, usually about 800 cars have been shipped; this year to same date only 100 cars were forwarded. The reduced shipments are due largely to frosts, which also ruined thousands of acres of cucumbers, beans and other early vegetables.

An excellent article on irrigation of sugar beets by Mr. R. L. Adams may be found on page 600 of this issue. Mr. Adams speaks from an experience of years. By mistake another article by him was omitted from last week's issue, though referred to on the editorial page. This will appear in a later Cultivator.

The recent snowfall in North Dakota is commented upon by the North Dakota farmer as being most acceptable, "putting the land in splendid shape and promising much to the farmers whose lands were becoming dry." California starts the season at a disadvantage, not having had a recent snowfall.

Agricultural News Notes of the Pacific Coast

Northern California

Napa observed a rose festival last week.

Suisun's first shipment of cherries was on April 25.

Only about 300 bales of hops remain in Sonoma County.

Indications point towards fancy prices for the 1911 hop crop.

Willows, Glenn County, is making plantings of lemon orchards.

The people of Winters will observe their Water Carnival on July 4th.

Biggs, Butte County, has subscribed nearly $9,000 for an alfalfa meal mill.

Biggs, Butte County, has produced rice that is now for sale in the open market.

The City of Roses, Santa Rosa, Sonoma county, observed May Day last Monday.

The Sebastopol Grange was recently reorganized with thirty charter members.

Preliminary work on the big valley irrigation project in Lake County is being done.

It is estimated that $140,000 was invested in hops in the Sacramento Valley last week.

Courtland, Sacramento County, claims the record for the first shipment of cherries.

Many farmers in Gridley and Biggs, Butte County, are already beginning spring irrigation.

The ice houses between Truckee and Verdi are filled with ice, over 134,000 tons being stored.

Chicago capitalists are buying lands for subdivision in the neighborhood of Red Bluff, Tehama County.

Berkeley has a poultry yard of nine hens which laid in 31 days of March an average of 20 5-9 eggs per hen.

The state horticultural commissioner is continuing a most energetic fight against the potato eel worm.

Alfalfa growers at Biggs, Butte County, are raising a fund for the establishment of an alfalfa meal mill.

Thompson Seedless growers at Yuba City are contracting to dispose of the coming crop at $15 to $20 per ton.

Red Bluff is awake to the necessity of a creamery, and is taking steps to incorporate a concern for its construction.

United States engineers are making preparation for the dredging of Suisun Slough, for which Congress appropriated $25,000.

Vacaville, Solano County, opened the fruit season for 1911 by sending out three boxes of cherries on Tuesday, April 25.

Poultrymen of Santa Rosa held a meeting last week and changed the bylaws so as to eliminate any branch associations of the Co-operative Association.

Manager McKevitt appeals for cooperation on the part of all fruit shippers. The Distributors represent nearly 75 per cent of the green deciduous fruit of the state.

The Placer Herald, of Auburn, reports "a few orchardists have lost their entire crop of peaches, pears and plums. As a whole it is safe to place the output at 60 per cent."

Central California

Tulare County is shipping out its Valencia oranges.

Tulare Grange is discussing the matter of mutual fire insurance.

Fishways are to be placed in the Kings River to enable ascent of the fish.

The rainfall at Prunedale, Monterey County, for the season is 18.52 inches.

Large tracts of orange land in Tulare County are being picked up and planted.

Some snow fell last week in Crane Valley, on the Tule River, at a 3,400-foot elevation.

The Armour Company will build a large brick warehouse at Porterville, Tulare County.

The State Grand Master visited the last meeting of the Grange at Greenfield, Monterey County.

The Fresno Republican reports "Muscat vines showing more frost damage than expected."

Farmers of Santa Clara County are preparing for a fair to be held in San Jose beginning August 26.

Four of the leading fruit companies of Lodi are planning for precooling of all shipments of table grapes.

Ten thousand acres of Egyptian corn are to be planted between Lemoore and Coalinga in Kings County.

The Sanger News finds that trellised vines showed less injury during the cold snap than the lower trained ones.

Kings County Horticultural Commissioner Sharp gives warning of the appearance of mildew, and urges early sulphuring.

The International Land Company at Fresno has 6,000 acres near Clovis which will be improved, Smyrna figs being the principal planting.

Commissioner Schulz of Tulare County reports concerted action in the destruction of mistletoe which has afforded breeding place for many scale pests.

County Bee Inspector Chrisman, of Fresno, reports a total of 2,664 colonies inspected during the month, of which 922 contained European foul brood.

Porterville citrus growers are discussing the matter of reducing the shipments of poor oranges, which it is admitted have seriously injured the industry.

Fresno proposes a universal crusade against the ground squirrel, and has requested the federal government to detail experienced men to assist in the work.

Pomona Granges of Tulare County are to picnic May 20 at Mooney Grove, the new county park. Four Granges are members, Visalia, Tulare, Dinuba and Orosi.

With raisins at four to four and a half cents, and the vines seriously injured by the cold weather, it is definite that big prices will obtain for the holdover yet in growers' hands.

Mr. George C. Roeding, of Fresno, finds that an experimental frost-fighting campaign during the middle of April frost easily saved forty acres of Muscat grapes. He will be better prepared before another spring.

Southern California

Montecito, Santa Barbara County, is considering a $400,000 road bond.

A horticultural thief in Orange County proceeds to dig up trees recently set.

A summer squash grower at Coachella netted fifteen cents per pound for his first crates.

For the first time a large acreage of beans will be planted at Calabasas, Los Angeles County.

The experiment station at Brawley, Imperial County, is planting 210 varieties of Persian grapes.

The regular meeting of the Tri-Counties Reforestation Committee was held at Anaheim May 4.

Negotiations are under way for a half-million-dollar sugar factory at Clearwater, Los Angeles County.

The supervisors of Riverside County contemplate appointing two men to aid in the patrol of mountain forests.

A cotton gin has been erected at Coachella to care for the 700 acres already planted in that section this year.

Escondido's lemon packing house has sent out thirty carloads of lemons to date, and still has fruit stacked to the roof.

Carload shipments of berries from Los Angeles will not be so extensive this year as last. The quality is above the average.

Farmers near Blythe, in the Palo Verde Valley, eastern Riverside County, are making extensive experimental cotton plantings.

A satisfactory offer has been received by the Orange County Dried Fruit Association for all apricot pits produced the coming season.

Onion growers at Coachella, Riverside County, are shipping car lots of White Bermuda onions through the California Vegetable Union.

Coachella Valley cotton growers are proposing to capture the silver cup at the Inland Irrigation Exposition to be held in New York in November.

The Indio Date and Cotton Company is making extensive plans for date planting on lands recently purchased in the Coachella Valley.

A meeting of apricot growers will be held at Ventura next Saturday, at which time it is hoped to perfect a permanent county dried fruit association.

Three irrigation companies of Orange County have begun suit to prevent the diversion of the Santa Ana River to non-riparian lands in San Bernardino County.

The manager of the Curtis Oil Company of Bloomington, San Bernardino County, recently returned from an Eastern trip, reports market outlook good for olives and oil.

With severe losses in the Mediterranean lemon-producing sections because of cold weather, California lemon producers can see only strong demand for the remainder of the output.

The Orange County Dried Fruit Association elected the following board of directors for the coming year: Victor Montgomery, J. G. Berneike, C. F. Bennett, W. C. Crawford, W. F. Greenleaf.

The Coast

Arizona is organizing a good roads association.

The next Spokane Poultry Show will be December 12-17.

Lacrosse, Washington, ships about 1,000 cases of eggs daily.

North Yakima and Zillah, Washington, held a blossom festival last week.

One concern is growing 100 acres of broom corn near Prosser, Washington.

North Yakima, Washington, estimates an output of 3,000 cars of apples.

The next Spokane Poultry Show will be held in that city December 12-17.

The Verde Valley in Arizona has the greatest acreage under cultivation this year.

A snowstorm covered the ground to the depth of two inches at Rigby, Utah, last week.

The food and dairy commission of Salt Lake City is making a campaign on dirty dairies.

Grain growers at Pendleton, Oregon, have ordered sacks for the next season, paying 6⅝ cents.

Fruit growers of Pomeroy, Washington, estimate the frost damage only nominal, with average crops promised.

A big dam on Umatilla River, near Pendleton, Oregon, stores waste flood waters to make 10,000 acres productive.

Farmers near Pilot Rock, Oregon, will handle their own grain this season through the Farmers Co-operative Union.

A speculator from Portland has purchased practically all of the old hops in Western Oregon and Northern California.

The University of Arizona has extended a call to Dr. A. H. Wilde of the Northwestern University to become its president.

Wenatchee, Washington, is preparing exhibits for the Dry Farming Congress to be held this summer at Colorado Springs.

Crane Creek Irrigation Company at Weiser, Idaho, is constructing a system which will deliver water to 30,000 acres of land.

The premium list for the next Interstate Fair at Spokane, Washington, which will occur on October 2-8, has already been issued.

The Sheep of Arizona are freer from scabies this year than for many years past. Examination of 400,000 failed to discover a single case.

The Northwestern Fruit Exchange of Portland, Oregon, estimates only slight damage to the apple crop because of the cold wave.

That irrigation is advancing is proved by the receipt recently of a carload of pumping machinery at Wenatchee, Washington.

Owing to some flaw in the title, four men at Toppenish, Washington, have made filings on close-in farms valued at over $300 per acre.

Kingman, Mojave County, Arizona, has promise of an excellent grazing season, owing to ranges being in splendid shape. Sheep shearing practically finished.

Baby Chicks

Gardena Hatchery, Gardena, Cal.

(Egg capacity 100,000)

Largest in So. California.

After May 1st we reduce prices on our **Baby Chicks.** Any one still in the market will do well to write for prices, as we can furnish them at a low figure. We guarantee a full count of **live** chicks at your Express office.

SULLIVAN'S
Buff Orpingtons

1000 birds to select from. Trios, $7.50 and up. Eggs for hatching, $2 and $3. Special selection; prices on application. Mr. & Mrs. W. S. Sullivan, 50 Market St., Agnew, Santa Clara Co., Cal.

F. BALDWIN'S WHITE LEGHORNS

Winners from Seattle down. Bred as layers first. Stock, any age for sale. Eggs $6 and $10, per 100. Settings $2 up. Send for New Free folder and prices.

1st. Ckl A. Y. P. Ex 46 Wash. Ave. San Jose, Cal.

I'll Start You in Poultry on the Make-Good Plan

—Set you up in a paying business all your own—a business you can control and expand indefinitely—one you can operate on little capital and in small space—one that will give you real independence, pleasure and profit. Mail me a card to-day for my book containing the remarkable terms on which I am selling Queen Incubators and Brooders, freight prepaid. I have started over 61,000 people on the road to success. The Queen goes out on the make-good plan, the most liberal ever offered on a high grade incubator. My 1911 Poultry Guide and Catalog explains terms fully. It's a down-to-date poultry book, practical, concise, helpful—best book of the kind published. Write and let me mail it to you free.

WICKSTRUM, Queen Incubator Man, Box 53, Lincoln, Neb.

Hub Poultry Plant

S. C. White Leghorn Breeding Stock for sale, all large hens and heavy layers. Also a few yearlings.

Write for prices.

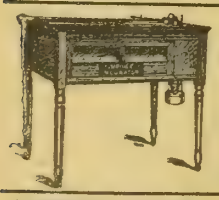
White Leghorn Eggs for hatching	$1.50 per 15
White Plymouth Rock Eggs	$1.00 per 15
White Indian Runner Duck Eggs	$3.00 per 13

EARL M. HUBBARD Colton, California.

Rancho Mirasol White Leghorns

Eggs for Hatching, January to June. Day Old Chicks, March to June.

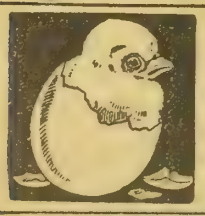
PASADENA, CALIFORNIA.



Don't Make a Mistake Remember

There is but one **JUBILEE.** Our customers tell us that there is but one Incubator and that is the **"JUBILEE."**
Let us send you our Catalog. It's free.

JUBILEE INCUBATOR CO., Sunnyvale, Santa Clara Co., Cal.



White Leghorns

A Standard Strain of Great Layers and Great Winners. None superior. Prices reasonable. Descriptive booklet of our stock and farm and recipe for mixing best and cheapest egg-producing mash, sent free for stamp. Eggs, stock and baby chicks for sale. Also a grand lot of cockerels.
On a separate farm, we have an extra fine lot of Buff Orpingtons, from which we can furnish stock, eggs and baby chicks at popular prices.

Practical Poultry Culture

BRINGING UP THE BABY TURKEYS.

By Mrs. A. Basley.

A subscriber writes: "You tell us a lot about chickens, can you tell us how to raise turkeys? We are having poor luck with them though we try hard and take good care of them, have lost twelve before they were two weeks old. We took them from the turkey hen and tried to raise them in a brooder; should we have left them with the mother?"

Letters of inquiry that come without signature are usually consigned to the waste paper basket, for the rule is to take no notice of anonymous letters but as a reply to this inquiry may help others this rule will for once be overlooked.

One of our correspondents asks if "chick feed" is a safe or proper food for little turkeys, and another requests me to tell exactly how I feed and care for little turkeys.

"Chick feed" is neither a safe nor a proper food for little turkeys, although it is a most excellent food for little chicks. In fact you may be sure of success when you feed it to little chickens and sure of failure if you feed it to little turkeys.

Now as to my way of rearing little turkeys, I do not pretend to say that mine is the only way, but I do say that not only do I succeed in raising little turkeys, but those who have followed my directions are as successful as I have been, and those that make a failure, did not follow my plans. I have been criticised as being too fussy and particular about little details, but I think it pays to take good care of the little things for a few weeks, for turkeys are delicate only when they are little, and if properly cared for then, will be strong and hardy when they mature.

The way I feed and have fed for years is as follows: When the little turkeys are twenty-four hours old, I put freshly laid eggs into cold water and boil them for half an hour; chop them up fine, shell and all; add equal parts of bread crumbs; feed dry, taking away what they leave, feeding the mother separately.

The next day I feed the same adding very finely chopped lettuce or dandelion leaves or young green mustard leaves and tender young onion tops. This is their breakfast and supper. For dinner they have a little curd, cottage cheese some call it, made from clabber milk. In a few days I add cracked wheat to their supper and if I am short of dry bread crumbs, I add rolled breakfast oats to the egg and bread crumbs. I always chop up an onion a day with egg and bread crumbs unless the onion tops are very young and tender. Onions are an excellent tonic for the liver and kidneys, preventing worms and curing colds, so I use onions freely. In a few days I commence to add wheat to their food and at two weeks of age I gradually arrive at giving them wheat or rolled oats for breakfast, in the middle of the forenoon a head of lettuce to tear up and eat; at noon cottage cheese, and at about four or five o'clock, their supper of egg, bread crumbs or rolled oats, lettuce and always the chopped up onions. I give them clean water three times a day in a drinking fountain and a similar fountain of sweet skimmed milk.

A word about the cottage cheese. I am very particular in making it not to allow the clabbered milk to become hot. I use either a milk thermometer, letting the heat only come to 98 degrees, or I keep my finger in the milk and as soon as it feels comfortably warm I take the milk off the fire, pour the curd into a cheesecloth bag and leave it to drain. If the milk scalds or boils the curd will be tough, hard like rubber, and indigestible enough to kill little turkeys or chickens. When I lived in the home of the wild turkey, Oklahoma and Kansas, I learned much about tame turkeys. There "Corn is king," but I was cautioned never to give corn to the young turkeys until after they "sport the red." That is until their head and wattles become red, which happens at about three months of age, for it was said that corn always sours in their stomach. It was there that I heard of a man who brought up his turkeys on nothing but onion tops, curd and grit, and they did well.

One of my experiences in the land of the wild turkey may serve as a warning to others. I had a good old Buff Cochin who was mothering a brood of nice little turkeys. She was most assiduous in her care of the turkeys, she clucked to them all the day, called them up to eat all the time and it was surprising to see how those little fellows grew at first, but one after another drooped and died till only one was left. The others under turkey mothers were doing well, so I took the lone little one out at night and put him under a mother turkey in the meadow and saved his life. The old hen had overfed the others. Chicken hens are too anxious to feed the little turkeys. They scratch for them, coax them to eat, and the little turkeys are such greedy voracious little things that they overeat, and in consequence die. I much prefer to bring up little turkeys under turkey hens or even in a brooder rather than under a chicken hen. The best way of managing a hen is to keep her in a coop, letting the little turkeys run outside, or else tie the hen under a tree by her leg. I only feed the little poults three times a day just what they will eat up clean in ten minutes. With a turkey hen I can leave wheat in a trough always accessible and she will never overfeed the young. The turkey mother will take a few mouthfuls herself and then move slowly and deliberately away, and her babies will follow her, having only taken one or two grains each. This is more like the nature of the wild turkey, and the nearer to nature one can keep in raising turkeys the better will be our success.

Nature's wild turkeys are only hatched in the spring when there are grubs and worms in abundance, with plenty of green grass leaves and no grain but what is sprouting, and above all nature never mixes mashes to turn sour and ferment on the little stomachs. The hard boiled egg and the curd take the place of the bug and the grub, for we cannot supply the turkeys with anything like the amount of grasshoppers, grubs, worms, larvae or insects which nature provides in the home of the wild turkeys. Another lesson we may learn from nature's book: Wild turkeys are only to be found where there are springs and streams of pure water, and they never wander away from the water. Give the turkeys plenty of clean, pure water to drink.

There are two chief causes of mortality in little turkeys—lice and overfeeding. Before giving the turkeys to the mother to care for dust them well with buhach, and continue to do this once a week until they are too large to handle. Look for lice on the head and on the quill feathers of the wing and rub the powder well into them.

Don't use grease, or you will kill the turkeys. Lice and overfeeding kill thousands of little turkeys; overfeeding kills more than lice, and if it does not kill them it stunts their growth, and unfortunately until they begin to die at about six weeks of age, one scarcely realizes that they have been overfed.

I can tell you just how overfed turkeys will die. First, they will commence to walk slowly, lagging behind

the others as if tired, then the wings will droop and they will look sleepy and will not eat, will look at the food as if they wanted it, but were too lazy to pick it up, then diarrhoea will set in, the droppings will become yellow, and sometimes green, and death will soon follow. If you hold a post-mortem examination, as you should do over everything that dies in the chicken yard, you will find the livers of these little turkeys have yellow or white spots on them, and on cutting into them you may find that these spots are small ulcers that extend through it. Sometimes these ulcers are quite offensive. This comes from overfeeding which gives the liver more work than it can do, and it breaks down.

The liver is the largest organ in the turkey's body and it seems to be the most delicate. If you can keep that healthy you will have healthy turkeys. Onion and dandelion leaves are tonics for the liver and the green food keeps it healthy, whilst the animal food and a small amount of cereal will make the frame of the turkey.

But suppose you should see one little turkey in the brood beginning to walk slowly, what should you do? I would catch that little turkey and give it a liver pill such as we use in the family, and follow this with a one-grain quinine pill every night for a week. And as if one turkey commences to feel ill, the others are almost sure to follow, I would give a little Epsom salts in the water to the whole flock and cut off some of the grain in the feed. You will probably save the flock, but they may be stunted in their growth, and their livers many months later may break down from being weakened by that first attack of liver trouble.

Chick Feed Is Bad for Turkeys.

Now about the chick feed. It is composed of a number of different grains. Some of these grains are extremely difficult of digestion for turkeys. The chief of these are cracked corn, Kaffir corn, Egyptian corn, sorghum seed, millet, etc. I could scarcely believe this until I had an actual demonstration of it. Then I discovered that the cracked corn does not commence to digest in the crop, as the gastric juice of the crop does not seem to have any influence on it. It passes through the crop and on through the proventriculus to the gizzard, arriving there hard, and not in the least softened or digested, and there it commences to ferment, causing diarrhoea, or else passing away without digesting. I am not scientific enough to know the reason for this, nor why wheat should be softened in the crop and partly digested before reaching the gizzard, but I know that it is so. They told me in Kansas that corn sours on the turkey's stomach, but it does not exactly sour, it ferments, and there is where the trouble comes in. Sour milk is sour, but this is from lactic acid, and lactic acid seems beneficial to turkeys, whilst the souring of grain, bran, cereal of any kind, bread or cornmeal is a ferment, and ferments are very injurious to fowls of all kinds, and especially so to turkeys.

Mrs. Charles Jones, the best authority on turkeys in the United States, agrees with me about feeding turkeys. She writes: "A diet of part corn agrees with chickens, but I have never yet fed corn in any form to young turkeys but that sooner or later they would give up the unequal contest. A little neighbor girl who had a great deal of the care of turkeys said the least little bit of corn meal makes them die. She had learned this while watching them as she fed them."

There are many beautiful valleys in California where turkeys may be grown to great advantage, but even on small ranches a few may be kept. The climate of the Imperial Valley seems especially well adapted to turkey raising. The raisers of large numbers of turkeys should remember that most likely there is something lacking in either the soil, climate or water. In most places in the Imperial country there is not sufficient grit, that should be supplied artificially. One breeder I know there goes once a year to the mountains taking sacks and two sizes of screens with him. There he digs out and screens all the disintegrated granite that he needs for chickens, ducks and turkeys, for a whole year. This and turning his turkeys out on the alfalfa keeps them perfectly healthy and he has no trouble whatever in raising them.

In many of the other beautiful valleys of California turkeys can be raised without any cost to the farmers by turning them out to rustle for a living if they can have an alfalfa patch to graze upon or wheat stubble to glean over. They fatten extremely well where they have acorns to eat or walnuts and olives and apple orchards where they can find the fallen fruit. It is surprising to see how large an amount a full-grown tom can swallow whole. Wild turkeys that fatten on the pinons, the seeds that fall from the pine cones, or those that eat the pecan nuts in Oklahoma and Texas, are most delicious, but those that fatten here in California on the gleanings of the olive trees, the fat ripe olives that fall to the ground in the early spring, equal in flavor and delicacy those wild ones. I wish more farmers in California would keep turkeys.

FEATHERS.

When you don't give much don't look for much in return.

Don't hold the market turkeys too long, sell three weeks before the holidays, or else hold until February.

Look over the market reports of last year, this will enable you to sell when prices rule highest.

Keep account of sales made, number of head, number of pounds and price received for same; if account is kept of cost of the feed, as it should be, you will know how much profit or loss you have sustained.

It is impossible to be too well posted, but the great value of knowing will not amount to much unless the knowledge is put in practice.

An ax is the best remedy for roup; in short the only remedy, if the "cured" birds are meant for the breeding pen. Such strenuous measures will save disappointment another season.

Scared hens are never profitable.

Many find employment and profit in pigeon rearing. If it can be arranged, they would give employment to the restless boys and girls.

Fix up all the leaks in the roof, if too far gone to mend with a few boards or shingles, nail roofing paper over the old roof. If given a coat of tar and then sanded, such a roof will be weatherproof for years.

This also makes a fine lining for the poultry houses, when nailed closely. Lice and mites will not harbor in it either.

The Low Cost of Living

Los Angeles Wholesaler Solves the Problem for the Farmer.

"How to overcome the excessively high cost of living" is a question that is claiming world-wide attention. It has fallen to the lot of the McStay Supply Company, a large wholesale and manufacturing concern of Los Angeles, to solve this problem in a manner beneficial both to consumer and producer.

They have for years been selling to the merchants only, but two years ago began working on a plan whereby they could place merchandise in the hands of the consumer direct from the producer and wholesaler. They have their own factory where many goods are made and sold direct to the consumer without middlemen's profits, and other lines of merchandise are bought in large quantities and sold to the farmer at the same prices they sell to the storekeeper. Fruits, honey, nuts, and produce of all kinds are purchased direct from the grower, and in turn distributed by them direct to the consumer, thus eliminating all middlemen's profits. This arrangement results in the farmer getting better prices for his products, and the consumer getting more for his money.

Their business is conducted on a cash basis, and that their plan is an immense success is amply verified by the tremendous business they are now doing with the farmers direct. They are shipping goods into nearly every community south of San Francisco, and in Arizona and Nevada. Many letters from their customers show that a handsome saving is made after paying freight charges.

For the benefit of comparison with prices you pay your dealer, they quote here on some of the items handled by them.

It would undoubtedly pay you to get in communication with them and get their catalogue. A line or order addressed to The McStay Supply Company, Los Angeles, California, will bring prompt and beneficial results to yourself.

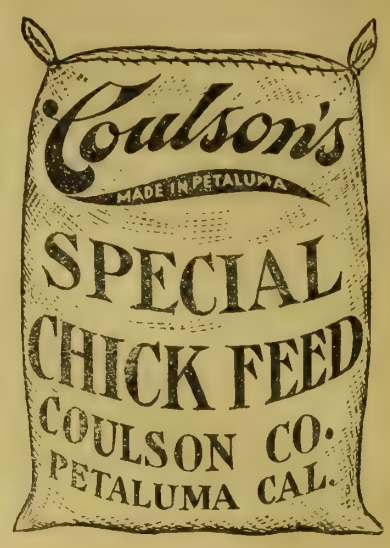
No Irrigation Required for Chickens



***Did You Ever Think* how much you save on maintenance when poultry is your crop? No engine to buy; no pumps or pipes; no fuel.**

That's why the poultry business is so successful. The returns are almost net profits and there is a natural increase.

No seed time. Just a perpetual daily harvest of broilers, eggs and stewers. A market always waiting, always anxious to get what the poultryman has to offer.

The California market is greatly in need of more poultry and eggs. Thousands of dozens of eggs are imported from the East. Carloads of Poultry are shipped in daily.

Sales are made for Actual Cash

There is No Crop that Pays Better on Investment and Labor than Poultry

We Have Simplified Poultry Raising

With our book "CHICKENS," which we will send free while they last, you can begin on any number of birds desired. You can have a profitable business in a short time, and IT WILL GROW MORE PROFITABLE EVERY YEAR.

We supply the proper food from the time the little chick leaves the shell till it goes to market. Every stage of progress is met; every requirement satisfied. We also carry a complete line of accessories.

Our goods are carried by some reliable poultry dealer in every poultry center. If your dealer cannot, or does not want to supply you, write to us direct and we will give you the name of our nearest agent.

You Can Easily Secure the Best Poultry Food on the Market
We Are the Largest Poultry Food Manufacturers in California

Cypress in Arizona

By Dr. F. Franceschi.

It appears to me very doubtful that the Monterey Cypress will stand the temperature of zero Fahrenheit, having seen them killed outright in Southern Europe at perhaps 12 degrees or 15 degrees Fahrenheit. But it is not less doubtful that it will stand the summer heat and drouth. The Monterey Cypress grows wild only in a particular spot of our coast, continually exposed to heavy fogs and very cool breezes. Old residents in Southern California like myself can well remember how many of these trees perished during the dry years at the end of the last century, and not only in the hot inland valleys, but also right here on the coast, like at Santa Barbara. The Arizona Cypress, Cupressus Arizonica, is a very distinct species, and it was my privilege to introduce it into gardens some twelve years ago, not only in California, but also in Europe, where it is much prized. For the special purpose of your correspondent from Wilcox, namely, for windbreak, it will be eminently adapted, standing as it will the highest and lowest temperatures of that locality, keeping well its lower branches, thus making a most effective shelter, and, last, not least, growing faster than other cypresses. Many of those planted at Montarioso, a little over two years ago, are over ten feet high, and they never received a drop of water during the summer months.

Bamboo for Turning Stock

If your subscriber from San Luis Obispo will try bamboos for "turning stock," and being good soil binders along banks of streams, he is sure to find that several among the Chinese and Japanese bamboos would make excellent soil binders, provided that stock will not go near them, as both cattle and horses will relish them and shouid there be any rabbits in the neighborhood, every new shoot will be nipped as quick as out of the ground. There are many plants which are armed with more or less formidable thorns, and as effective as a barbed wire fence, but I know of very few which will combine together the very freely running and suckering from the roots, and the "non-edibility" of their foliage. The ordinary "black locust" of the eastern states, Robinia Pseudo-Acacia, would be first-class for binding, and for a strong hedge; cattle are however very fond of the foliage. The Osage orange, Maclura Aurantiaca, although a great "rooter," has no underground runners like the preceding, and, moreover was given a black eye in California, as a most prolific scale breeder. There is a shrubby "night shade," from Argentina, Solanum Glaucophyllum, ten to twelve feet high, which beats every plant that I know for running; its greyish, velvety foliage is not touched by cattle, and its light blue flowers make it quite ornamental; its stems however may be not thorny and woody enough to prevent cattle going through. Perhaps the best plant that I can recommend for the two-fold purpose will be that particular kind of "century plant," from which the "sisal hemp" is obtained, Agave Rigida Sisalana. This will come in bloom very young, and at the same time will send out numerous suckers, which will quickly bloom. The countless bulbils produced on each panicle in the place of seed pods, will soon drop to the ground and take root, thus forming in a very short time a most picturesque hedge, absolutely impenetrable to man or beast, a capital soil binder, and an efficient fire break.

Irrigation Notes

One hundred Colorado inches equal five and one-sixth acre-feet in twenty-four hours.

In twelve hours of the day, 640 trees carrying 21,192 leaves each will evaporate 3,875 gallons of water, or a total of 31,000 pounds.

The mean annual rainfall of the world is 36 inches, which is about 50,000,000 cubic feet per square mile of the earth's surface per annum.

A gallon of water, United States standard, weighs 8½ pounds and contains 23 cubic inches. As there are 1,728 cubic inches in a cubic foot, the annual rainfall deposits 374,026,000 gallons on each 640 acres. This means over 1,500,000 tons, or about 2,400 tons per acre.

There are four general methods of irrigation, flowing in open ditches, flooding where the water covers all the land to a certain depth, infiltration or seepage, which includes subirrigation, and a method used much in Florida, but very slightly in semi-arid countries, aspersion or sprinkling.

The smallest amount of rainfall in humid countries which will produce a profitable crop is usually considered about 34 inches during growing season; California, however, shows excellent crops with a precipitation of 7½ to 20 inches; Colorado's average is 22 inches; while in India 49 inches is required. In France and Italy a precipitation of 50 inches is thought necessary.

In California, Idaho, Nevada and Utah 50 miner's inches equals one cubic foot per second; this under four-inch pressure from center of orifice. In Arizona and Montana 40 miner's inches equals one cubic foot per second under six-inch pressure from top of orifice. In Colorado 38.4 inches equals one cubic foot per second, measured under five-inch pressure from the top of the orifice.

Riding and Walking Beet Plows

Killefer Walking Beet Plow

This is the strongest plow on the market. Can be had with straight or offset standard, and has one piece land side. Nothing but hard plow steel is used in the Standard Shin Landside and point. Point and Shin are reversible. We guarantee this plow to do satisfactory work in any beet section.

Two-Row Riding Beet Plow

It is especially adapted to large acreage, as it does double the work of single plows with but little more draft, and leaves the ground in fine condition for hauling off beets, as it does not throw up large clods.

The Standard Shin Landside Point and wings are made of very hard steel, which we have rolled for this work, and extras are always on hand for immediate shipment.

Both plows can be had with or without steering device. Write or call on us direct if your dealer does not have these tools.

Killefer Mfg. Co. 2210 Santa Fe Ave. Los Angeles, Cal.

TELL US YOUR TROUBLES. We make special tools to order for handling special work.

Orange Seed

Now is the time to start your Orange Seed Beds. We are prepared to furnish you with Fresh Orange Seed that will produce strong, healthy Seedlings. Ask for quotations, stating quantity required.

MARKET GARDENERS: We make a specialty of catering to your trade and are always ready and glad to help you select those seeds best adapted to your requirements.

NURSERYMEN can find in our Store everything they need in the way of high-class Tree and Plant Seeds as well as other supplies such as Raffia, Budding Knives, Imported Sprinkling Cans, etc. And don't overlook our "Non-Kinkable" Garden Hose if you wish to avoid the constant repairing that the old kind requires.

DWARF MILO MAIZE
A DRY LAND CROP

Where the rainfall is limited or water is expensive there is no more profitable forage and dry feed crop than **Milo Maize.** It belongs to the sorghum family of tropical Asia and Africa, where it is the principal grain grown.

We have secured a stock of a dwarf variety that has been thoroughly tested in Southern California and Arizona, yielding two and one half tons of grain per acre. It grows a stalk 4 to 5 feet high with large, compact, erect heads, and stock especially like the sweet flavor of the stalk.

Write for cultural directions and prices.

Garden and Field Crops

IRRIGATION IN THE VEGETABLE GARDEN.

More than three years ago the following, written by Mr. Q. A. Lobingier, appeared in the Cultivator. As requests for similar information continue to come we repeat it in full:

It is astonishing how persistently the recently arrived settlers or the inexperienced native will "water the sun." By this is meant sprinkling the surface, or allowing the water to flow rapidly across the land in shallow ditches and shutting it off as soon as it reaches the end of the ditch. Either method is often more injurious than beneficial. Few people have even the faintest conception of the power of the sun and wind to evaporate every drop of water applied in this manner. The loss is not alone in evaporation, but the soil becomes baked and difficult to work, and without life, as we are apt to express it.

Prepare For It.

The true way to irrigate the vegetable garden is to have everything planted in rows—wide or narrow, according to the kind planted, and have a flume across the head of the garden having galvanized iron gates with slides, so that the water is under perfect control. Make the furrows between the rows—one or more according to the width, and allow the water to run rather freely until it reaches the end of the row, after which close the gates so as to allow just as much water to pass through as will reach to the extreme end of the furrow. This is more difficult to do on some soils and grades than others, but approach it as nearly as you can. Allow the water to run until the soil is well soaked.

No Royal Road.

No rule can be given as to how long this will take, as the soil and grade are leading factors in the matter, and each particular garden is a problem of itself. A good irrigator is like the poet, born not made. Not one person in fifty of those who work in our orchards and gardens comprehend the theory and practice of successful and economical irrigation. Many can wet the ground, but it is with a woeful waste of water.

Frequent irrigation keeps the soil cold and packs it so that the air cannot circulate through it. Thorough irrigation at long intervals, followed by good and frequent cultivation between, thus allowing the soil to get well aired and warmed, will bring best results. By planting everything in rows it is possible to supply each kind with just what water is needed, for some crops need less than others.

"Never Permit Your Plants to Suffer for Water."

I am asked the question "how often do you irrigate" more frequently than any other, and I must answer, just as often as the crop needs it. We have no set rule. The weather, the soil, the particular crop, the care had in cultivation, are all to be considered. Long experience enables us to detect at a glance, by the appearance of the soil and plants, any need for water. The nearest approach to a rule that we have is "never permit plants to suffer for water." The freshness and vigor of the crop, the condition of the soil, the atmospheric conditions are all to be reckoned with and any one having average intelligence can, by a little observation, soon learn.

Get your water deep into the soil and then by the most careful, persistent cultivation, keep it there for the plants to evaporate it through the foliage, instead of allowing the sun and wind to drink it up—something that will surely happen if you merely sprinkle or wet the surface.

A GOOD POTATO SECTION.

The last year's experiments with Irish potato growing in the sandy loam soil of Merced County have proved very successful and will probably result in the planting of a large acreage this year. The sandy loam area which lies a few miles north of Merced has long been famous for its sweet potatoes and now produces about three-fourths of the entire crop of the state. "Merced Sweets" are known throughout the West for their even size and excellent flavor. The soil in which they are so successfully grown is rich in iron and this ingredient imparts the peculiarly rich, nutty flavor for which "Merced Sweets" are so famous.

Mr. J. M. Smith, a very successful sweet potato grower of Atwater, has been experimenting for some time with the Irish tubers. He says in part:

"Last year I planted one sack of Early Rose potatoes the last week in March on one-sixth of an acre. In June I dug from this 20 sacks of fine potatoes. The last week in July I put back in this same piece of ground, as seed, part of the potatoes dug from the first crop and from this also got a good yield. My first crop yielded at the rate of 120 sacks to the acre which, with the yield of the second crop, and with potatoes at the present price, would bring a handsome return. My experiments have convinced me that this soil is exceptionally adapted to the growing of Irish as well as sweet potatoes."

Hitherto potato growers have thought that only heavy soil was adapted to the successful production of Irish potatoes and the peat land around Stockton has produced the greater part of the state's supply. The advantages of sandy loam soil for potatoes are obvious—the land is easily kept free from weeds and there is no danger from too much water.

Different soils have capacity for absorbing moisture per 100 pounds of dry earth in the following amounts: Quartz sand 25 pounds, calcareous sand 29 pounds, loamy soil 40 pounds, clay loam 50 pounds, pure clay 70 pounds, dry peaty soils and adobe sometimes one pound to every pound of dry earth. The ordinary arable soil holds from 40 to 70 per cent of its own weight.

The wise irrigator stores as much as possible of winter flood waters as well as irrigation waters in his soil during the months when trees are supposed to demand little or no moisture. No tree ever becomes so dormant that it does not demand some moisture, but the principal point of winter irrigation is storing for summer needs.

One second-foot equals 450 gallons per minute.

Deciduous Bush-Tree Fruits

APRICOT OUTPUT.

There can be little question but that the output of apricots will be far below normal. The injury from the cold wave through the Great Valley was not so serious on this fruit as some others. At the same time some sections report "Not over 25 per cent of normal crop;" others "Possibly 50 per cent." Around Fresno we understand they will be practically a failure. One strong indication of the shortness of tne crop is in the material advance which prices have taken within the last week or two. Some buyers are already offering to sign up contracts for the coming season so that the wise producer is keeping his own counsel, likewise his contracts, to himself.

From reports of subscribers in differing sections we quote as follows:

J. N. Ballantyne, Acampo, San Joaquin County.

From inquiry of others and estimating my own orchard I feel safe in saying the yield will not be up to last year. Some orchards have been dropping badly in the last few days. Have heard of as high as twelve and a half cents being offered in this district since the frost a few days ago. Think majority of growers have sold around here.

As to peaches, Mr. Ballantyne reports:

One buyer was working this district this week offering eight cents for this year's crop of dried peaches. Think all kinds were taken at that price. A number of the growers in this district sold. My orchard will not have as good a crop as last year, and have heard that Muirs are short quite generally.

W. S. Allen, Lockford, San Joaquin County.

Personally I have no apricots. Some fruit men say good crop, some as low as 10 per cent, and one buyer told me in sampling that he picked twelve before he found one without a black pit. Of course those will blight and fall. I believe few realize how many are affected. I should say not over 20 per cent.

H. S. Reed, El Centro, Imperial County.

Regarding the apricot output of Imperial Valley for the coming season, will say that our trees blossomed about a week late owing to the cool weather, but were exceedingly profuse. Some thrips appeared at the time the blossoms were setting, causing a sufficient per cent to drop off, thereby eliminating fruit thinning.

The Horticultural Commissioner of Yolo County Reports:

"Apricots and almonds were short in blossoming and crop expectations were further reduced by unfavorable weather conditions after the setting of the young fruit. The estimates vary considerably according to locality but it seems that the yield will not be more than twenty-five per cent of a full crop of apricots and about thirty per cent of almonds. In Capay Valley the almond and apricot crops suffered more than any others."

Mr. Beers of Santa Barbara Says:

Frost and cold rains reduced the crop of peaches and apricots to a low point, in most parts of the state, but in this county, with the exception of a few low places, these conditions have not had any evil effect. The report from Lompoc, Santa Rita and Santa Maria shows a more than usually heavy setting of both peaches and apricots. With the short crop from other sections, our county will realize top notch prices, as our fruit is of a high grade and finds a ready market.

WALNUT OUTPUT.

J. A. Montgomery, Secretary of the Los Nietos Walnut Growers Association, reports that the outlook for the coming walnut crop is most favorable for a normal crop. The trees are in fine condition though they carry much less than usual; they are even in much better condition than for years; nuts are setting well and continued good weather will mean a good crop.

Mr. Beers of Santa Barbara County reports:

The setting of the walnuts is encouraging and, unless some unknown conditions arise, there promises to be a banner year for the walnut growers. Some large acreages have been planted this spring, and a large number of young trees will come in bearing this coming season, making the prospects exceedingly bright in the line of this industry. Old hardshell orchards have been taken out, in some sections, and young stock planted in their stead, the young trees being selected with care, from stock grown from selected nuts.

There is a considerable blight showing up, but the more observant growers report less evidence this season than for a corresponding period of the season of 1910.

The extended grafting, done on older walnut trees, is showing good results; a majority of the grafts have taken and the present prospect is very cheering that this method of renewing the life and usefulness of old trees will be thoroughly tested out in our section. The grafting of several years ago proved more valuable than the growers had anticipated. The grafting of this year has been, largely, with blight-resisting scions. The idea being to test both the advantage of grafts, and the reliability of resistant stock growing on softshell body.

BEST 'COTS FOR THE DESERT.

Answering a request for information as to the best early apricot for Imperial Valley or other desert conditions, Mr. H. S. Reed of El Centro, writes:

"We have been unable to get any definite information regarding best early varieties of apricots for the desert other than that secured from the various sources of last year. From one source we would be told that the 'Royal' was the earliest commercial variety. From another source, not to plant the 'Royal,' as the 'Newcastle' was much preferable on account of being ten days or two weeks earlier.

"We have about forty acres in our young apricot orchard, which originally consisted of 'Royals' and 'Blenheims.' We have budded over two-thirds of them to 'Newcastles' and took the gamble on their turning out of commercial size.

"Malaga grapes are now in blossom, and give promise of producing an exceptionally heavy crop. Just as soon as our desert people learn the necessity of late summer irrigation for the purpose of storing up starch for the next season, and the deep winter soaking of the soil to establish deep root systems upon their vines, they will then, but not until then, reap great profits from their table-grape vineyards, which can be offered upon the markets in advance, and without competing with any other district in America."

BUY BABY CHICKS NOW--Special Prices.

We have 5000 per day of most all standard varieties of chicks. Right now we are making special prices on chicks in lots of 100 or more. Send today and state what kind of chicks you wish, and we will be glad to quote the price. We sell hatching eggs of all standard kinds, also cocks, cockerels, and laying hens and pullets.

Write us your wants today. Largest Baby Chick Dealers in the world. We handled 23,000 baby chicks in one day. That's the largest hatch ever made in one day in California. Get the free 64-page catalog; send today. The world's largest chick dealers.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Young Walnuts Dying Back.

I put out eight acres to walnuts one year ago, Placentia Perfection on native black root, planted on loam soil. Trees did well last year, some of them made a growth of about seven feet. Gave them plenty of water and thorough cultivation. This spring I find about one-third of the trees dead, some down to the ground, and others almost to the ground. Can you tell me what the trouble is? What should I do with them, take them out or let them grow as they are?—Subscriber, Garden Grove.

It frequently happens that walnut trees die back as described and it is almost always those that grew the most rapidly the preceding summer. This happens because the wood of the new growth has not fully developed, and most often because at some time late in the summer the trees had been in want of moisture and were partially dormant, then made a new growth that did not harden before the flow of sap ceased. The trees will send out a number of shoots near the ground, and of these the most vigorous should be selected to make the new tree. Cut off the dead stock and place a strong stake to support the new growth. Then be sure the tree does not want moisture, to the depth of four feet, at any time before November next. Walnut trees do not differ from other trees in wanting the best and most even conditions as to moisture.—J. B. N.

Questions of a Beginner.

(1) Can cockerels that are to be used for breeding be kept in a pen by themselves without danger of it causing sterility? (2) Would it be best to keep a few hens with them, and if so, how many? Which would be best, hens or pullets? (3) How many cockerels could be kept together in one pen and what size house and yard would be necessary? (4) I know you advocate line breeding, but some advise constantly bringing in new blood; how is a person to tell which to believe? (5) I have a breeding pen of line-bred White Rocks and one of Rhode Island Reds, selected by the Hogan System and fancy points combined. Next year I expect to mate a pen of each breed alone for heavy egg production. Would you advise me to line-breed these or buy a male bird from some other strain of heavy layers each year? (6) How many of these hens could be kept in each yard with one male, or could forty or fifty hens be kept together with two or three males? (7) What would be a fair price to charge for the setting of these eggs? (8) My yards are 28x150 ft. with fifty hens in each. I wish to fence off one end to grow green feed in, alfalfa in one side and kale in the other. Do you think this plan of furnishing green feed would be satisfactory?—R. B. Hanford.

(1) Cockerels should be kept entirely away from hens or pullets after they are three months old. I usually keep thirty in a house with one old male bird to police them. He will keep them from fighting and boss the whole yard. (2) Keep no females with cockerels. (3) I found thirty cockerels with one cock was the most convenient number. My house was 8x16 feet, and held the thirty-one quite easily. (4) Line breeding is all right if properly done. "Inbreeding" as it commonly practiced, will result in the deterioration of the flock. (5) Decidedly line breed your selected pens in this way, by selecting every year or by trap-nesting you will build up a strain of which you will be proud. (6) I found that from eight to ten females was the best mating with one male for White Plymouth Rocks. And ten to twelve for Rhode Island Reds. You could, however, keep twenty White Rocks or twenty-four Rhode Island Reds with two male birds in each pen for your utility stock. (7) The price of eggs would depend entirely upon the achievements of your fowls, that is, how near to Standard they come and the average egg output of each hen. (8) I do not think your plan of green feeding would be satisfactory. You would have to add green food to the ration and you could not turn the hens in on the kale until it was three or four feet high. The fowls like the kale and soon destroy it if it is small enough for them to eat the heart out. By having a separate plot of kale and also of alfalfa to add to the ration you will greatly lessen the price of feeding and keep the hens vigorous.—Mrs. A. Basley.

Chicks Dying.

Can you give me a remedy for my young chicks? They become droopy, the droppings are exceedingly foul smelling and lodge in the down around the vent. Needless to say they soon die. I am feeding corn bread and sweet milk and have been feeding West Coast Chick Feed. The chicks are free from lice, have pure water and green runs and the roosting places are clean.—Subscriber, Imperial.

When little chicks take cold, or are chilled or overheated it usually affects the bowels instead of the lungs. The feeding and care that yours are getting are not to blame, but they have been either chilled or overheated either in the incubator the last week or in the brooder. The overheating or the chilling so weakens the bowels that they cannot digest the food and that then ferments or turns sour, or even sometimes putrefies. Anything that weakens the digestion or the vitality of the chick has almost the same effect. Lice and mites will do this. Now as to the best thing to do. First remove all the sick and put them in a separate brooder for each sick chick is a menace to the others, is in fact, a little bit of poison, smelling bad, and liable to infect the others or at any rate the one he sleeps near. Secondly remove gently with your fingers the dried-on droppings, do not wash off, as that will chill the already weakened bowels; if sore, grease with a little carbolic salve, and thirdly, give a good feed of rice boiled in milk with a tablespoon of ground cinnamon to each pint of milk. The cinnamon is very soothing and healing to the bowels, and at the same time it is a good disinfectant, and I have found it more helpful in cases of diarrhoea with chickens and turkeys than any medicine. When the chicks can eat onion, that and raw potatoes chopped fine are excellent. The onions I give freely, they are a preventive to colds and a tonic for the chick's liver and kidneys. Onions give vigor.

Bowel Trouble.

Can you let me know what is the matter with my incubator chicks: they have bowel trouble. I feed chick feed and hard boiled eggs. I started to feed them the third day after they were hatched. I also had some chicks with eyes swelled up and nearly all died. What is the rem-

edy? I now have some of them that have the feathers all ruffled up.—J. J. B., Brawley.

J. J. B.'s chicks whose eyes swelled up most likely came from roupy stock. They may not have inherited it but such chicks come into the world with a weak constitution and unable to resist disease. Here prevention is better than cure. Clean the brooders and sun them daily and see that the chicks do not crowd at night and the moment you see one sick little chick take it away from the others.—A. B.

Tanning Calf Skin.

Please give method of tanning calf skin so as to make lace leather.—Subscriber.

The skin should be salted on the flesh side as soon as the hide is cooled after removal, using ten to twelve pounds to a full-sized skin. After salting roll the hide tightly. When ready for tanning place the hide in "soak," simply water to remove blood and salt. After being left in this 24 hours the tail and feet may be cut off and the flesh adhering scraped off, after which the hide should be placed in lime water. To make the lime solution take a bucket of water to each quart of lime. When thoroughly slaked and mixed, immerse the skin and allow to lie for three to four days. Thoroughly wash in cold water. Scour and pound in good soapsuds for half an hour, after which take white vitriol, alum, and salt, one tablespoonful each to skin, and dissolve in sufficient water to cover skin. Let remain in this 24 hours. Wring out and dry. To soften, oil with neat's foot oil or currier's oil. It may again be washed out in soapsuds and hung up until nearly dry, when it should be worked and softened. If it should remain hard and refuse to soften, repeat the soaking in suds.

Too Big an Egg Record.

In our account of egg record sent in by Mr. G. L. Hawley, we erred in that we said three hens produced 152 eggs during February. Mr. Hawley disclaims making any such statement, the three should have been twelve.

Address of Experiment Station.

Will you please give the address of the Agricultural Experiment Station of the University of Wisconsin?—Subscriber, Goshen.

Letters intended for the Wisconsin Experiment Station may be addressed to W. A. Henry, Director, Madison, Wisconsin.

Goat Milk.

What is the particular use of goat milk. Is it richer in butter fat than cow's? If mixed with cow's milk would it raise the test. Would there be a kick coming from the creameryman if put in with other milk?—M. E. F., Goshen.

The milk of goats is of particular value to infants and people with weak digestions. It is sold largely to hospitals and to particular customers. It is not especially rich in blutterfat, but more rich in nutrients than cows' milk. We do not think it would be wise to produce goat's milk to mix with that of cows. There might be no kick from the creamery man, but to mix a product which usually retails at from 25 cents to 50 cents a quart would hardly pay from the producer's standpoint.

Ferrets.

Will ferrets kill gophers?—M. E. F., Goshen.

We do not think ferrets would be as successful with gophers as with ground squirrels. They certainly would kill them, but in the long runways they might be lost and they are too expensive to risk that.

Beetles in Vineyard.

I send beetles which have done much damage in vineyard. They hide during the day under clods and the coarse bark of the stumps and eat the buds at night. Are they the flea beetle?—D. C. F., Upland.

These are tenebrionid beetles and live entirely upon dead and decaying wood. It must be the leaf hopper that is doing the injury to your young buds. Spray with kerosene emulsion. Formulas for this are given under Nos. 13 and 14 in the issue of November 3rd, 1910.

Hulling Walnuts.

Do the walnut growers use hullers? If so, are such machines manufactured in this state? I have but a small quantity of nuts and do not wish to make investment unless necessary.—Subscriber, San Diego.

There is a machine on the market used for hulling nuts which do not voluntarily drop out, but if the trees are kept in a good growing condition the nuts will usually drop. The exception is in case of very dry and hot weather just at gathering time.

Brown Spots on Fig Leaves.

I send fig leaves covered with brown spots. What is the trouble and the remedy? The leaves wilt and drop off. —Subscriber, Pacific Beach.

These leaves were referred to Mr. C. O. Smith, Plant Pathologist at the Southern California Laboratory, also to Mr. Roeding of Fresno. Neither recognized any particular disease, though the spots have the appearance of a fungus. So far as we have heard the trouble has not appeared anywhere else in the state. We will be glad to investigate the trouble further.

Tobacco Culture.

Is tobacco culture profitable in this state? If so, what is the best kind to plant? Is there a factory where leaves may be disposed of in Los Angeles?—R. J., Fullerton.

There have been cases of successful tobacco culture and curing in this state, but the difficulties are great, the heat being the worst drawback. There are many cigar factories in Los Angeles, but we do not think one should consider planting, excepting in an experimental way, until the market was thoroughly investigated.

Locust Fence Posts.

I see a subscriber from Healdsburg inquires about the lasting quality of locust posts. In the East where we could get them they were preferred to any other post, and lasted much better than any other, often as long as forty years. We never dipped them in creosote or any other solution. That being a rainy country and moisture always present in the ground, I should think they would last longer in California. Locust is of a slow growth in the East, but from young trees which I have seen here about, I believe it to grow much faster in this climate. We preferred the posts cut when dormant rather than in the full flow of sap. Locust trees here will not grow as rapidly as the eucalyptus.—M. A. Kendall, Holtville.

One second-foot equals two acre-feet in twenty-four hours flowing constantly.

One hundred California inches equal four acre-feet in twenty-four hours.

An inch of water covering an acre of ground equals 27,154 gallons.

Timely Ranch Suggestions

IRRIGATING SUGAR BEETS.

By R. L. Adams.

While originally the moisture for the sugar beet crop was secured from the rainfall alone, during the last two years irrigation facilities have been developed until at the present time much reliance is placed upon the artificial supply of water. Water for this purpose is drawn from artesian wells, from gravity flows, or by pumping from streams and wells.

How Used.

Under California conditions most of the water is put on by flooding the land, using some form of basin, sloping or contour checks. The aim is to give the land a thorough soaking just before it is prepared for the crop. By the utilization of proper farming methods the water is then conserved for the plant's needs. Often one, two or even three crop, irrigations are given to maintain a steady moisture supply. In general, the growing period of the crop may be divided into three parts as regards the moisture supply. During the germinating stage and until the beet attains six or eight leaves only a fair supply should be present. It should be a steady supply however.

From the eight leaf stage until six or eight weeks before harvesting the crop can use enormous quantities of water, and a regular supply should be supplied at all times during this period. During the last six or eight weeks of growth a diminishing supply should be present, in order to permit maturing of the beets.

Must Follow Correct Principles.

Proper irrigation of the sugar beet crop is a matter requiring an intimate knowledge of the soil where the crop is growing. Knowledge of its physical character to the depth turned by the plow is not enough. Inquiry should proceed on down into the soil and subsoil until by repeated borings the character of the soil is known to a depth of ten feet. Only by a proper appreciation of the presence of hardpans of cement, clay or lime, deep layers of gravel or coarse sand, or bodies of standing water, can intelligent irrigation be practiced. The first two sets of conditions will effectually shut off capillary movement of water while the latter condition will aid materially in supplying moisture, depending of course on the distance of water table from the surface of the ground. A knowledge of irrigation principles backed up by a thorough understanding of the physical nature of the fields in question will make a combination insuring the correct use of water in growing sugar beets.

When Not To.

Conditions of too long a growing period fostered by excessive moisture conditions either throughout the plant's growth or during the last six or eight weeks when it should be maturing, will prevent the formation of sugar, and result in low testing beets of excessive, overgrown, ungainly weights. This is to be guarded against and provision must be made to so handle the land and water that a diminishing supply will be present at this time. The control of the moisture supply is secured by proper soil preparation and crop cultivations as well as by the actual application of water turned on from the irrigation ditches.

When Needed.

In addition to the appearance of the soil and subsoil, the beet itself is a good indicator of its needs as regards moisture during its active vegetative growing period. When the healthy, thrifty, light green color of the foliage turns first purplish, then a glossy deep green, and finally lighter with a rapid deepening to yellowish tinge it shows in consecutive stages the increasing need of water for the plant's use. Often a wilting down of the foliage during the day not overcome at night will prove to be an additional indication. Beets not receiving water will gradually assume ripening characteristics, but instead of having the solid, firm, juicy, high testing roots of normally matured beets, will be rubbery, dry and low testing.

By supplying plenty of water at the time the crop needs it, maintaining that supply regularly until time for letting the beets mature, and then gradually letting up on the supply, maximum crops will result. In other words, the transitions from one stage to another should be regular and smooth without running to one extreme of insufficient water, or the other of overabundance, so that the plant will at no time suffer from abrupt changes. In field practice the attainment of proper conditions is far easier than the study of those principles from a printed text. A large amount of common sense backed by conditions and an intelligent understanding of the crop requirements will solve the various factors connected with proper irrigation.

Much Yet to Be Learned.

Irrigation is generally practiced in California, but even so, has not yet attained its highest point of advancement in sugar beet culture. Many fields at the present time are susceptible to more and better irrigation practices, with the attendant promise of greater crop returns.

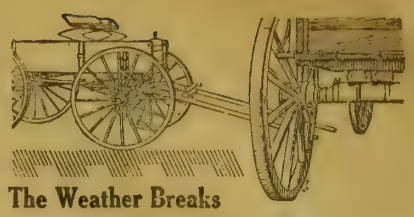
CUTTING UP LARGE LANDED ESTATES IN CALIFORNIA.

By Amos Reem Kanaga.

A new era is now dawning on the Golden State of California; the movement is of such great import and interest that its present status is not realized in our own commonwealth.I refer to the disintegration of our large landed estates, cutting the lands up into small farms of 10 to 160 acres and selling these small tracts to incoming farmers, men who have come and will come from every state in the Union.

For forty years past the great drawback to this state was the well-founded opinion in the East that California was no place for a poor man or one with small means of $5000 or $10,000, or even $20,000. As a result this opinion is prevalent in the East and every man here should do what he can to let the people back there know what is now on in our coast country. About five years ago some of our big landowners commenced to let go; they were inspired with a belief that big lordly holdings were not profitable. Back of the settling of this land was irrigation, the factor that made the settlement of the land possible, for without water on the land it would not be settled in small holdings.

At Willows, the old Doctor Glenn



The Weather Breaks Down More Wagons Than Weight Does

Rain soaks in around the spokes; it freezes and expands with a force iron can't hold. Water-soaked joints rot; cracks widen and deepen.

Good paint, made of

"Dutch Boy Painter" White Lead

and pure linseed oil, makes wagons weather-proof.

It gets into every pore and seam, it sticks and wears as no other paint does.

Keep your wagons painted with pure white lead and cut out repair bills and cost of new wagons.

THE CLIPPER

There are three things that destroy your lawns Dandelions, Buck Plantain, and Crab Grass.

In one season the Clipper will drive them all out.

Clipper Lawn Mower Co Dixon, Illinois.

estate comprising 250,000 acres is now being divided and colonized and men, women and children are pouring in there from every part of this great land of ours. Pittsburg bankers are back of this colossal enterprise.

In Fresno county around the town of Kerman is another vast district that has been cut up. This farm consisted of 28,000 acres and up to the present time they have sold 20,000 acres to men who own all the way from ten to 100 acres. We have counties today in California with less population and wealth than they have in this one tract.

At Merced the Crocker-Hoffman Land Company has a tract of 37,000 acres which they are cutting up and selling to farmers in small tracts. The colonization is not done by the above company but they are disposing of it in tracts of 2000 to 6000 acres to men of experience who in turn do the colonizing. Every acre of this land can be irrigated as soon as it is settled on, for they have one of the best gravity water and canal systems in the West. When this land is fully settled on with farmers who own from ten to forty acres, it will have the effect of doubling the population of Merced, the county seat, for this vast acreage completely surrounds that city.

Up in Colusa county, W. K. Brown and associates have purchased 19,000 acres near Princeton where they are now installing a big modern irrigation and canal plant.

Natomas is a district some little distance north of Sacramento. It is a new enterprise of 60,000 acres, being reclaimed by means of a levee. The land is to be sold in ten to 100-acre tracts. One can hardly grasp the meaning of this colossal work. Just think of 2500 new families coming from the middle western states and settling on this land.

I have not yet named one-half of the new land empires that are now being cut up, but I have given the reader a faint idea of what is going on in Central California.

In the southern part of this state they are also doing big things in creating a new West. Go over the Imperial valley and through the orange orchards in the Hemet district where they are carving new homes out of the desert by the aid of canals and water. Spend a day or two at Needles and visit the great enterprise that is now being installed there. It is a district of the highest merit, for water, soil and growing power it can't be beat in all the West. The canals are now almost completed whereby water is carried to every part of a tract of something like 40,000 acres. In the middle of this land is a town called Cottonia, and four miles northeast is another new place where they have a store and postoffice. These people will raise cotton here to equal any produced in Georgia, but the land will raise almost any crop known to civilization. Something like $150,000 has been spent here during the past year. The development of this section is due to three Los Angeles men, W. L. Hollingsworth, W. B. Hole and J. B. Evans.

At Yuma is another big undertaking carried through by the reclamation service; that work costs $5,000,000 and will reclaim over 100,000 acres. Most of the land in the last two named places lies in Arizona, but as they are on our state line I have mentioned them.

A second-foot is a cubic foot which passes a given point in ditch or canal in one second of time.

$90,000 Daily

Now Spent for No-Rim-Cut Tires

Over 600,000 already sold—enough to equip 150,000 cars. All because they cut tire bills in two.

The sale of Goodyear tires has multiplied six times over in the past two years. Last year they jumped to $8,500,000. They are now running double last year.

Sixty-four leading motor car makers have contracted with us for these tires. To supply them and tire dealers we are running our factories twenty-four hours per day.

The reason lies in a patented tire—the No-Rim-Cut tire—10 per cent oversize. Men have found that this tire saves one-half on their tire bills. And the tire has become the sensation of motordom.

The No-Rim-Cut Tire

Here is the Goodyear No-Rim-Cut tire as it fits any standard rim. When you adopt this tire you simply reverse the removable rim flanges so they curve outward. They curve inward with old-style tires. This change can be made in ten seconds.

The rounded edge of the flange then comes next to the tire, and rim-cutting is made impossible.

No Hooks on This Tire

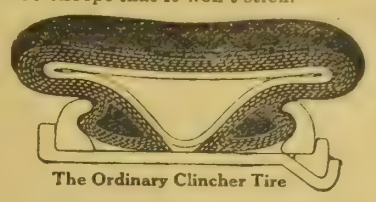
The ordinary tire—the clincher tire—has hooks on the base to hook into the rim flange. That is how the tire is held on. See the next picture.

When you use this type the removable rim flanges are set to curve inward. Note how they dig in when the tire is deflated. That is why the common tire will rim-cut if you run it flat.

Ordinary Clincher Tire

The No-Rim-Cut tire has no hooks on the base. It is held to the rim by flat tape, made of 126 braided wires, vulcanized into the tire base. These make the tire base unstretchable.

The tire can't come off because the base can't stretch. Nothing can force it over the rim. But, when you unlock and remove the rim flange, the tire comes off like any quick-detachable tire except that it won't stick.



The Ordinary Clincher Tire

This braided wire feature is controlled by our patents. And there is no other way known to make a safe tire which will stay on without hooks.

10% Oversize

These No-Rim-Cut tires, where the rim flanges flare outward, can be made 10 per cent over the rated size and still fit the rim. And we give you that oversize without extra cost.

That means 10 per cent more air—10 per cent greater carrying capacity. And that, with the average car, means 25 per cent more mileage per tire.

These two features together—No-Rim-Cut and oversize—will double the service one gets from a tire under average conditions. Yet Goodyear No-Rim-Cut tires cost no more than other standard tires.

GOODYEAR
No-Rim-Cut Tires

Our latest Tire Book, based on twelve years spent in tire making, contains many facts which motorists should know. Please ask us to mail it to you.

MISCELLANEOUS

It requires but 2 to 4 cents worth of the darkest and cheapest honey to make a gallon of the richest and most delicious beverage drink. It is a perfect substitute for fruit where fruit is scarce, and a perfect substitute for water where water is poor. A tablespoonful of evaporated milk in a glassful makes buttermilk that is worth twice as much as the natural kind. Process and right to use it two years 25 cents. C. W. Dayton, Chatsworth, Cal.

Imported Carneaux—The great squab pigeon. A limited number of mated pairs at $3.00 per pair. Chas. N. Taylor, Artesia, Cal.

An Exceptional Opportunity to secure at a bargain, an ideal apple orchard, located in the best apple section of the world's greatest apple district—Pajaro Valley, Santa Cruz County, California.

The property consists of 51.85 acres. Number of trees, 3784. Number of bearing trees, 3601. Age of trees, 7 to 10 years. Varieties: Belleflowers, 926; Newtons, 1140; Spitzenbergs, 1219; Missouri Pippins, 203; Baldwins, 132; other varieties, 164.

Dwelling house, 4 rooms and storeroom, 3 porches. Packing house, first story 55x70, second story 38x70. Blacksmith shop, barn and wagon house; main building 25x40, shed 18x40. Chicken house 12x30, and small house. Cement tank for water, 6000 gals. Water piped to dwelling, chicken house and barn.

Personal property: Two horses, 2 sets harness, 1 heavy and 1 light orchard truck, 1 wagon sled, 1 spring sled, 1 gasoline engine, Bean pump and 150 feet spray hose, 1 wheel cultivator 2 side-hill plows, 1 drag harrow, 1 1000-gal. tank, windmill and pump, 2000 tree props, 150 cull boxes, 6 ladders, 25 chickens. Dec. 1st, 8 tons hay, forge, blower tongs, pinchers and other tools Some pieces household furniture.

1910 crop 10,500 loose boxes—4450 Belleflowers, 2833 Newtons, 1711 Spitzenbergs, 1456 other varieties. Estimated crop for 1911, 20,000 boxes, or about 300 tons. Buyers now offering $25 per ton orchard run. Crop goes with place if sold before July 1st, 1911

This property is located about seven miles from Watsonville, only five minutes' walk to Corralitos Postoffice and splendid school. Soil: Santa Cruz loam and Pajaro sandy loam. No irrigation, no freezing, no burning. Ideal California climate. Price $17,500. One-half cash. Adjoining properties in same class are held at $500 an acre. For further details and list of 50 orchard bargains write at once to Watsonville Farm & Forest Realty Co., 320 Main St., Watsonville, Cal. Reference: Pajaro Valley National Bank.

For sale—80 acres of land, four miles south of Hanford in the heart of the dairy belt, nearly all in alfalfa. Good buildings, fences and water rights. All checked and leveled. Telephone and rural mail delivery. Address Frank McClellan, Hanford, Cal.

Pacific Coast Lands—Farm lands appraised for prospective investors. Reports on agricultural projects, soils, irrigation, drainage, etc. Paul Goodloe, 1049 Phelan Bldg., San Francisco, Cal.

For Sale—48 acres, all in alfalfa, good buildings, fenced and cross-fenced under the ditch; ¾ of a mile from Newman; $300 per acre. Box 133, Newman, Cal.

Eighty acres finest eucalyptus land, 4 miles from Santa Maria, Santa Barbara County, about one mile from railroad; price $2000, if sold at once. A. Frederiksen, Arroyo Grande, Cal.

Farms for rent or sale on crop payments. J. Mulhall, Sioux City, Ia.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

Poultry Ranch within 13 miles of Los Angeles, 20 acres, $1500.00; 10 acres, $1000.00. North Los Angeles Developing Co., 147 No. Spring St. Mr. Ellis.

For Sale—5 acres, joining Roeding Park, Fresno. Address Mrs. Florence L. Bollinger, Fresno, Cal., General Delivery.

Fertile eggs for hatching. Choice varieties. White Rocks, White Wyandottes and White Orpingtons at $1.50 to $4.00 per setting; $6.50 to $10.00 a hundred. Ducks—White Muscovy, Dark Muscovy, White Indian Runner, White Pekin, Buff and White Orpington, $1.00 to $3.00 a setting; $5.00 to $12.00 per hundred. Send for Circular. Pheasants' eggs in season.

WICK'S FOWL WHITE FARM, Moorpark, Cal

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Wound.

A valuable colt, eight days old, ran into a harrow and injured his breast, laying open a wound about six inches in length between the leg and the body. We sutured the wound with gut. Please tell me how to care for him.—Subscriber, Encinitas.

Very young colts are liable to contract blood poisoning from deep wounds, hence it is to be hoped the wound was thoroughly cleansed and disinfected before suturing. If much swelling ensues and lameness becomes extreme within five days, cut the stitches and allow free drainage. Bathe two or three times daily with 2 per cent creolin solution or 3 per cent carbolic acid solution, and apply freely to the moist surface a healing powder made by mixing boric acid 4 ounces, zinc oxide 2 ounces, iodoform 1 ounce, and calomel ½ ounce.—F. G. M.

Olive Pulp.

I am offered olive pulp at $10 per ton. The analysis submitted is as follows: Water, 12-15; ash, 4; proteins, 10-12; carbohydrates, 50-60, and fats, 8. From this analysis would you consider this an economical food for poultry, hogs and cows?—B. D. F., Los Angeles.

Only the digestible parts of a food are valuable. The digestible constituents are not stated in this analysis, but estimating the digestible proteins 8, carbohydrates 36, and fats 6, the value would apear to be approximately $25.60 as compared with wheat bran at $27.50 per ton. Wheat bran contains water 12, ash 5.8, protiens 12, carbohydrates 62.9, and fats 4; digestible protiens 9, carbohydrates 39, and fats 2.9. The nutritive ratio of the olive pulp would be 1-6.7, while 1-3.8 is that for the bran.—F. G. M.

Oats and Barley.

I can buy barley at $31 per ton, and oats at $35 per ton. Kindly inform me as to the relative feeding value of the two.—Subscriber, Covina.

When the price of oats is $33.50 per ton, the relative value of barley should be $33 per ton. The nutritive ratio for the oats is 1—7, as compared with 1—7.5 for the barley.

Lameness.

Five weeks ago my mare became lame. The ankle swelled first, and now the hock is swollen. She supports little weight on the foot—lameness severe—allowing the toe to just touch the ground. I have blistered the limb with caustic balsam, but it does not seem to improve. She is due to foal in four weeks.—Subscriber, Herman.

It is evident you did not locate the point of injury or the cause. Have your horseshoer pare the bottom of the foot—sole and frog—in search of a nail wound or other injury. Failing in this, follow up the limb, searching every part—joint, bone, cord, etc.—for painful areas or enlargements. It would be haphazard to advise treatment without more definite information.—F. G. M.

FRUIT DRYING.

The Likfresh Company is meeting wonderful success with its new process of fruit drying. The simplicity, economy and rapidity of operation, compared with the old-time methods of drying fruits, will place this invention in the forefront as a producer of revenue for California.

Tons more of fruit and vegetables can be raised and preserved with all the natural freshness and flavor. Water brings out the dormant richness. It seems almost incredible that a dried piece of cauliflower can be brought back to color and flavor as it was in the garden; that a dried ear of corn will grow to its original size and sweetness. Yet these are true. Not only will vegetables return, but fruit, berries, fish and meat will assume the state in which they were before placed in the drying bins.

New drying plants should spring up; more men and women should be employed and greater capital be invested in the preserving industry of California than ever before.

A further announcement will be found on page 583 of this issue.

BETTER THAN EVER.

Thousands of dollars have been spent in new improvements at Coronado Tent City this year, notwithstanding that the famous bay and ocean pleasure resort was pronounced absolutely perfect in every respect by more than 300,000 visitors last season. Extensive improvements have particularly been made in the palm cottages, which now possess every convenience, and are as cozy and comfortable as one could wish. Several new wood and canvas kitchens, with screen doors and windows, have been erected for the use of occupants of palm cottages should they desire to do housekeeping. Many new tent houses have been constructed, while the several hundred in use last season have been rejuvenated to the standard of newness. Tent City's famous board walk, along the bay, has been doubled in length and rivals that of Coney Island.

In addition to bathing, boating, fishing, etc., there will be no end of amusements at Tent City this season. The Joy Ward will teem with novel attractions, the theater will be open and dances will be given every night, except Sunday, in the new $30,000 pavilion, which has one of the finest dancing floors on the Coast. Music for dancing is furnished by a superb orchestra of eight pieces.

On June 17 Ohlmeyer's famous Coronado Tent City Band, fresh from its triumphs at Willow Grove Park, Philadelphia, will inaugurate a series of daily free concerts covering three months. While the regular season does not open until that date, many people are already at the resort for the summer and every day marks new arrivals.

Tent City is now, at this early date, assured of a larger number of guests than ever enjoyed its cool summers and countless attractions in former years. A beautiful illustrated booklet setting forth the many attractions of Coronado Tent City has just been issued by Manager J. S. Hammond.

General Household Notes

HOMESICK.

Homesick ain't like th' other sicks
  You get an' hafto go to bed
An' drink th' stuff th' drug-stores mix,
  Or have things tied aroun' your head,
An' when your ma she wash your face
  An' use th' silver bresh an' comb
To comb you, an' she fill a vase
  With flowers' 'cause you're sick at home.

Homesick, ain't med-cine sick at all;
  It ain't a sick like stummick ache
'At make you double up an' bawl
  An' say you didn't eat th' cake,
Until your conscience it ache, too,
  Nen you con-fess, an' your ma smile
An' say she got a joke on you
  Buhcause she know it all th' while.

Homesick ain't when they see your tongue
  Or feel your pulse, or your ears buzz,
Or doctor listens at your lung—
  But, oh, how much you wisht it wuz!
Homesick is when you go away
  A-visitin' all by yourself,
An' miss th' clock at ought to stay
  A-tickin' on th' mantel-shelf.

An' folks tell stories to you, too,
  An' try their best to make you laugh.
Th' wind cries in th' chimbley flue,
  An' in th' barnyard is a calf
'At bawls an' bawls—an' worst part yet
  Is all th' time how well you know
No matter how homesick you get
  An' want to go home, you can't go.

—Wilbur D. Nesbit in Harper's Magazine.

REACHING A VERDICT.

By Oscar E. Youmans.

The slender figure standing before the judge sobbed convulsively, and from time to time hid her face behind her hands.

"How old are you?" asked Judge Brown, eyeing her over his glasses.

"Sixteen, sir," she answered, raising her eyes to his face.

"Didn't you know that it was against the law to make moonshine whisky?" continued the judge, sternly.

"I had to do something, sir, after my father died. Before that we had enough to live on. After he was gone, there was only granny and me. I wasn't strong enough to plow. I tried it, but somehow I couldn't keep the plow in the ground."

As she finished speaking she drew herself up to her full height. The judge looked at her slender figure, clad in a roughly-made gingham dress that barely reached to her worn, ill-fitting shoes. Her tawny hair would have been finest blond had it not been for the exposure of mountain life. She had plaited it in one long, rough braid, that hung down her back.

"So you couldn't make the plow work, eh?" continued the judge.

"No, sir; but I tried ever so hard."

The twelve jurors glanced at their own brawny hands and then at the girl's slender ones. Most of them remembered their boyish experience of not being able to make the plow stick.

"But I had to do something, sir," she replied. "The men living near brought the corn and I made the mash for them. That's pretty easy work for a girl to do, judge, even if she ain't over strong."

"I believe the supply you had on hand the day you were arrested was fresh, wasn't it?"

"Yes, sir."

"Did you sample any of the stuff, sheriff?" and the judge turned to that official.

"I certainly did, judge," replied the sheriff, sheepishly; "and I want to say right here that I never tasted better in all my life. Believe me, judge, when I say I never so hated to do a thing in my life as when I found I must arrest that little girl."

"H-u-m!" commented the judge.

"Well, I'm not very tender-hearted, hunting moonshiners all the time as I do," went on the sheriff. "There's not a cave in these hills, judge, that I haven't been in, and everybody knows me, even the children. I'd suspected for some time that whisky was being made at their cabin, but after the hearty way they invited me in and asked me to stay to dinner, why, judge, I was actually sorry I'd gone."

"That's true, judge," broke in the girl, as the other paused. "We're very lonely up there in the hills; we're always mighty glad to see somebody."

The sheepish look had become more apparent on the sheriff's face, and the jurors seemed to notice it, nudging each other significantly.

"We had a big piece of bacon that we'd been saving, the only one we'd had since father died. I cooked that for him," and she indicated the sheriff. "He certainly seemed to enjoy it," judge."

"I agree with her there, judge," and the sheriff actually smacked his lips as he remembered the occurrence. "There's many an older woman who couldn't fix up a dinner any better than that little girl," and he seemed eager to say a good word in her behalf. "Judge, you can just imagine how I hated to take her for making moonshine whiskey. Please be as easy on her as you can, judge. And you fellows, too," he added, turning to the jury. "Mark my words, Bill Sykes, I'll hold you responsible for a favorable verdict," and he pointed his finger at the foreman. "If it's against this little girl, I'll break your neck when you leave this room!"

"Here, here, sheriff!" cried the judge, sternly, rapping for order, as a ripple of merriment filled the room at the sheriff's earnest speech. "While you're a good sheriff, and all that, don't forget that I'm trying this case."

"Beg your pardon, judge," answered the sheriff meekly.

"What's your grandmother doing while you're up here in town?" the judge asked the accused, not noticing the sheriff.

"He took granny to his house," she replied, pointing to the sheriff.

"Is that so, sheriff?" asked the judge, looking at that worthy's flushed face. "Well, gentlemen of the jury," he continued, turning toward them, "in arriving at a verdict there are many things to be considered. After you acquit her—which I have not the least doubt you will do—we must consider what will become of this frail young girl, only sixteen years old. She is too delicate to toil for her daily bread. She also has depending upon her an old grandmother, nearly eighty years old. If you acquit her and allow her to go back to her mountain home, we have taken away her only means of support. I ask you again, what is to become of her?"

"If you please, judge," said the sheriff, blushing to the roots of his hair—he was scarcely over thirty himself—

"but I've got that all figured out. I don't know what on earth that little girl could do with her little bits of fingers to earn a living for herself and grandmother, but I'm no sheriff if I can't do it for her! Her grandmother is already at my house, and she can come, too. My mother will look after her until—until—"

"Until what?" asked the judge.

"Until she is a little older," answered the sheriff. "Then she's only got to say the word, and I'll guarantee to take care of her for the rest of her life!"

"I would like to hear the opinion of the prisoner at the bar," said the judge, smiling into the girl's wondering eyes.

"I don't understand," faltered the girl.

"Well, that ugly looking sheriff there says you and your grandmother can make your home with him. After a year or two, if you think you could endure him, he says he'll marry you."

She looked from the jury to the judge, from the judge to the sheriff before she replied.

"I think he's been awful kind, and I don't think he's so very ugly. I don't think I could do much better. I'll see what granny says."

"Gentlemen of the jury, what's your verdict?" shouted the sheriff, springing to his feet, excitedly.

"You shut up, sheriff!" cried the judge, hastily, although his voice was not so harsh as he tried to make it. "I'm trying this case! I hereby charge the jury to acquit the prisoner!"

And they did, without leaving their seats, giving the girl and the sheriff three cheers for good luck.—Country Gentleman.

HOMELY HINTS.

One tablespoonful of ammonia to a quart of water will clean gold or silver jewelry.

Place all cakes to cool on a wire sieve and never put them away in tins till perfectly cool.

Slices of lemon topped with grated horseradish makes a tasty and pleasing garnish for veal served in any form.

Ordinary wall papers may be cleaned with dough, or rubbed with a soft, clean flannel dipped in fine oatmeal.

Candles used for lighting the dinner table will not drip if placed on ice for two or three hours just before serving the meal.

To prevent old potatoes from discoloring, put one or two tablespoonfuls of sweet milk into the water in which they are boiled.

Doughnuts and cookies, as well as crackers, can be freshened by heating them thoroughly in a moderate oven, after which they should be cooled in a dry place before serving.

Do not throw your worn out hot water bag away, but cut it in round or oval pieces, and use them as mats to put under flower pots.

Coffee stain, even with cream in it, can be removed from the most delicate silk or woolen fabrics by brushing the spots with pure glycerine.

If when drying curtains they are hung double over the line, they will not stretch at all, as is so often the case when hung up by the edge.

For dusting women's heavily trimmed hats the best brush is a cheap shaving brush, as it is both stiff and small enough to reach every crevice.

Sew matting with raffia and prevent unsightly stitches of thread. Raffia is very strong and may be bought to match almost any kind of matting.

A simple way of repairing a rent in an umbrella is to use a piece of ordinary adhesive plaster. If the plaster is not black it may be easily colored.

Nails used in bathrooms and kitchens on which damp cloths and towels may be hung should be painted with enamel so that they do not leave rusty marks.

Carbonate of soda will remove the most obstinate mud stains. Rub off with a cloth or flannel dipped in the soda, then press well on the wrong side of the material with a warm iron.

When you need a cold cloth and haven't ice, try wringing a cloth out of cold water and shaking briskly in the air. The rapid evaporation will give you almost an ice cold compress.

New rope may be made pliable by boiling it in water for a couple of hours. Its strength is not diminished, but its stiffness is gone. It must hang in a warm room and must not be allowed to kink.

To soften boots or shoes rub castor oil thoroughly into the leather. This will renew the elasticity and life of the leather. Any ordinary oil will answer the purpose, but castor oil is the best.

When washing white dress skirts do not wring them, but hang them dripping wet on the line by the belt. The weight of the water prevents any shrinking and keeps the skirt an even length.

Lamp chimneys can be quickly cleaned by holding the hand over one end and putting the other end over the spout of a simmering tea kettle. Rub at once with a smooth cloth or tissue paper.

Try several shades of silk together in one needle when mending plaids or checks, using colors to harmonize with the predominating tones of the material. The mended part scarcely will show after it is neatly pressed.

If there are fruit stains on the table napkins rub with and soak in a little turpentine before washing. For mildew tie up cream of tartar with the soiled part and boil in clear water or rub with a fresh tomato.

AN APPRECIATION OF RICE.

Health requires a certain proportion of starch to be eaten daily, but there is considerable difference in the manner in which it is introduced into the diet. Potatoes, rice, white bread and macaroni are all composed mainly of starch, but rice is more delicate. Hence it is allowed early in a convalescent diet and even before white bread. The bread is usually toasted or dried like rusk before it is given to the invalid, who must be nearly recovered when the baked potato is allowed.

In some sections rice is always served as a desert with a sweet sauce or cooked in combination with milk and eggs. In other localities it is considered merely as a vegetable and as a substitute for white potatoes. The all-around cook serves it in both capacities and also makes it the foundation of various muffins, griddle cakes and fritters. One of my earliest memories is trying to eat some rice boiled in a bag and served with molasses. The hard, soggy mass retained the shape of the seams in the cloth and did not appeal to my childish appetite, while the rank sweetness of the raw molasses was even worse. To this day the sight of a mulberry ware plate, such as the unappetizing rice was served on at my playmate's home, calls to mind the old New England idea of how to use rice. Not until the

day of cooking schools did I learn to appreciate this cereal.

Good rice has no broken kernels, and there is now a law against facing inferior rice with anything to make it look glossy like that of the best quality. Old rice needs longer cooking than the new crop. Always wash rice in several waters to remove the floury portion of fine particles that will cook into a sticky mass.

When served as a vegetable, or cooked to be served as a foundation for other dishes, drop it slowly into rapidly-boiling water slightly salted. Use a generous quantity of water, keep it boiling rapidly all the time and uncovered. Stir at first a little with a fork, and at the end of 20 minutes test by taking a few grains between the fingers. If they will mash smooth, drain off the water, shake well, cover with one thickness of cheese cloth and set on the back of the range until well dried; each kernel should be separate.

Rice Pudding.

Cook one-quarter cupful of rice in one cupful of milk until thick; add one and one-half cupfuls of milk and let boil up; stir in a rounding tablespoonful of butter. Cool, add one-quarter cupful of sugar, a pinch of cinnamon, three gratings of nutmeg, one-quarter teaspoonful of vanilla, the beaten yelks of four eggs and the whites of two. Pour into butter cups set in a pan of hot water and bake one hour. Serve with rose sauce.

With Tomato Sauce.

To two cupfuls of hot boiled rice add one cupful of hot, well-seasoned tomato sauce; stir with a fork and serve as a vegetable.

Rice Fritters.

Beat two eggs light, add one cupful of milk, one-half cupful of boiled rice and a saltspoonful of salt. Mix one level teaspoonful of baking powder with two cupfuls of flour and stir into the other ingredients. Drop by spoonfuls into hot fat, and serve with a sauce made by boiling until slightly thick one and one-half cupfuls of water, one cupful of sugar and an inch piece of stick cinnamon.

Rice Surprise.

Cook one cupful of rice in boiling water until tender, drain and dry. Line a buttered melon mold half an inch thick with the rice, and into the center put two cupfuls of well-seasoned, chopped, cooked meat. Put a layer of rice over the top, put on the cover of the mold and steam the whole for three-quarters of an hour. Unmold on a platter and pour a tomato sauce round.—Alice E. Whitaker in Country Gentleman.

USEFUL HELP IN THE DINING ROOM.

The care of table linen is one of those housewifely accomplishments that every homemaker should excel in; and when one must economize closely it is far better to buy the unbleached linen and the ordinary washing and boiling will soon make it as white as desired.

If a piece of white oilcloth is placed under a child's plate with a square of linen over it, time and trouble will be saved in removing stains from the linen and the cloth can be kept clean twice as long.

Egg shells crushed into small bits and shaken well in vinegar cruets and decanters with plenty of hot suds will not only clean them thoroughly, but will make the glass look like new and the outside of glassware may be given a beautiful polish by first washing clean and drying carefully and then rubbing with a soft cloth dipped in alcohol and then in whiting. Allow this to dry on the glass, then rub off and polish with soft cloths.

The table cloths should be hung evenly on the line after washing, for if they are allowed to dry out of shape, stretching and pulling them will wear them more than use. A table cloth ironed with only two lengthwise folds, and then wound over a roller will look far better on the table than one with creases from too much folding, and any round piece of wood covered with flannel can be used for the roller. Table cloths wear out first in the folds and by cutting off a few inches from one end and one side all the folds will be altered, thus giving the cloth a fresh start.

The table linen can be made beautifully white with very little rubbing by dissolving enough soap chips in hot water to make a nice lather and then putting in the pieces and allowing them to soak for an hour before rubbing them out. There is enough borax in the soap chips to soften the water and whiten the fabric and they will never need boiling if they are washed through this suds before they become very soiled, and the finest pieces can be washed through the soap chip suds without any injury to the linen. Tablecloths should always be ironed lengthwise and from you, and if ironed quite dry and on the right side, the linen will be shiny and beautiful, hot irons and much pressure being requisites to success.—M. H.

HOMINY.

Take the amount of corn you wish (remember it swells), pick over and wash; pour over it about 4 to 6 times as much water in which common baking soda enough has been dissolved to make it feel slick. Cook about three hours, adding more water, if necessary. If in that time the hulls are not loose cook longer. Pour off water, wash in fair water several times, rubbing grains between the hands to loosen hulls (a collander set in a pan of water is fine to wash it in), dip the corn out of water, cook in fair water until tender, adding salt to taste. Can be canned and is handy when you don't know what to get for dinner.—Ranch and Range.

POPOVERS.

Beat three eggs until light; add one cup of sweet milk, a little salt, then two cups of flour, then add one more cup of sweet milk. Put in muffin pan, fill just half full and bake three-quarters of an hour. First have your oven quite hot, then moderate. This is most delicious served with bacon and a nice cup of coffee. They will puff up just like an empty shell.

FATE.

Full many a gem of purest ray serene
The dark unfathomed caves of ocean bear;
Full many a flower is born to blush unseen,
And waste its sweetness on the desert air.

—Thomas Gray.

IN CLUBLAND.

Hudson: How did you vote?

Mrs. Hudson: Well, I wanted to vote both ways, so I paired with myself.—Harper's Bazar.

Customer—Look here! This milk of yours is half water and half chalk, yet you advertise it as strictly pure.

Milkman—Madam, to the pure all things are pure.—London Sketch.

A Tool Is No Better Than Its Temper

"The man with the hoe," or any other farming tool, works against odds, if the temper of his tool is defective. Soft steel means a dull edged blade—slow work and a half-done job.

KEEN KUTTER

Farming Tools

have blades of hard, springy steel, with sufficient elasticity in them to recover from constant shock against clod and stone in perfect shape and with unturned edges. *That* is the all-sufficient reason why practical farmers use them.

Keen Kutter tools, for shop and bench, are all of equal high quality. The Keen Kutter line is the only complete and comprehensive one in which tools for every possible purpose are covered by one name and trademark. Ask for them.

"The Recollection of Quality Remains Long After the Price is Forgotten."

Dark comb	12½
Extracted white	8
Extracted dark	6½
Beeswax, lb	24@30

Hay.

Scott, Magner and Miller say:

Arrivals of hay for the past week were 1,927 tons, a trifle less than last week. The market on choice grades has shown somewhat of firmness, and we believe will continue so until the new crop makes its appearance. There is very little change to note in any of the other grades, and they move off slowly and with somewhat of pressure.

Complaints are generally heard in regard to crop conditions from the various districts, although we think that the little shower of rain which we had this morning, together with the cool weather which has been prevalent lately, will greatly benefit conditions.

At this time it is almost impossible to draw conclusions as to the coming crop, as it is very backward and without a doubt at least forty-five days late. These conditions, of course, will help materially to dispose of considerable of the old crop, of which there still remains a large quantity on hand.

The San Francisco Hay Association is now compiling statistics as to the quantity of hay remaining on hand in the warehouses and private barns on the first day of May, and we hope by next week to be able to give these figures, which at the present time are showing beyond expectations.

Export trade shows somewhat of improvement, and quite a little hay will probably move in this direction the coming week.

We quote the wholesale prices in round lots on today's market as follows, viz.:

Fancy wheat	13.50@14.50
No. 1 wheat or wh and oat	11.00@12.00
No. 2 wheat or wh and oat	10.00@11.00
Choice tame oat	10.00@12.50
Other tame oat	8.50@10.50
Wild oat	9.00@10.00
Stock hay	6.00@8.00
Alfalfa, ton	9.00@10.50
Straw	40@50

Grain.

Barley, fancy	1.50@1.52½
Barley, good to choice	1.45@1.48¾
Barley, poor to fair	1.40@1.45
Oats, white	1.50@1.60
Rye, new crop	1.40@1.50
Alfalfa seed	18@20
Mustard, brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, ton	23.50

Feed Stuff.

Alfalfa meal	17.00
Bran, ton	26.00@27.50
Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Rolled barley, ton	31.00@32.00
Rolled oats, ton	27.50@29.00
Middlings	32.00@33.00
Oil cake, ton	40.00@41.50
Cocoanut cake, ton	25.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	27.00@27.50

Citrus Fruit Market

LOS ANGELES, May 10, 1911.

With more than 8,000 cars of orange shipments in excess of last year at this date, it is indeed a most remarkable showing of prices which the fruit handlers are making to the growers. There are occasional sales at this time as high as $4 f. o. b. East. These are, of course, extra fine fruit, but the ordinary run of Navels is readily commanding $3.10 and $3.25. Some sections are sending in a large percentage of large offs; this compels somewhat lower quotations. Mikes, Seedlings, Sweets and others will practically all be cleaned up with the Navels by June 1. There will possibly be one or two associations unable to unload that soon. Foreign lemons received practically 60 per cent of normal. California's shipments, on the other hand, are largely in excess of normal, as is shown by the fact that this year's output is more than 800 cars in advance of last year's. Stock first-class and prices satisfactory.

Shipments.

Shipments of oranges to date since November 1, 1910, 25,161; lemons, 3,137; total, 28,298. To same date last season, 17,151 cars; lemons, 2,356; total, 19,507.

LOS ANGELES, Wednesday, May 3.—Four cars navels, 2 seedlings, 3 sweets, 1 Valencia and 1 car lemons sold.

AUCTION

35 FINE DAIRY COWS AND HEIFERS.

SERJEANT'S DAIRY

One block west of Western Avenue, between Santa Monica Avenue and 36th.

Tuesday, May 16th

at 10 O'clock A. M.

27 head of fine Dairy Cows, Jerseys, Holsteins and Durhams; all in first-class condition; many large, heavy milkers, several fresh, others coming in in two or three weeks; all fine dairy and family cows. 6 head of choice heifers coming in with first calf; 4 head of all-purpose mares, good drivers and work stock.

IMPLEMENTS: Milk Cans, Tubular Cream Separator, Bottles, Milk Wagons, etc., etc. If you are in the market for good, first-class dairy or family cows, do not miss this sale, as Mr. Serjeant is quitting the business and has instructed us to dispose of the same to the highest bidders.

Positively no limit or reserve. Free Lunch at noon.

Terms: $100.00 and under cash; over $100.00 one-fourth cash, balance 6 months' time with note and approved security. Liberal discount for cash.

H. SERJEANT, Owner.

RHOADES & RHOADES, Auctrs.,
Office 830-832 South Main St.,
Los Angeles.

NOTICE OF STOCKHOLDERS' MEETING.

Notice is hereby given that the annual meeting of the stockholders of the Cultivator Publishing Company will be held at the Los Angeles offices of the company, 115½ North Broadway, Los Angeles, California, at 9 o'clock A. M. Saturday, May 20, 1911, for the purpose of electing the Board of Directors for the ensuing year and for the transaction of such other business as may properly come before the meeting.

R. M. TEAGUE, Secy.

Los Angeles, Cal., May 6, 1911.

Pomona Deep-Well Plunger Pump

BUILT IN FOUR SIZES.

No. 18—Uses up to 20-horse power
No. 28—Uses up to 30-horse power
No. 38—Uses up to 40--horse power
No. 58—Uses up to 65-horse power

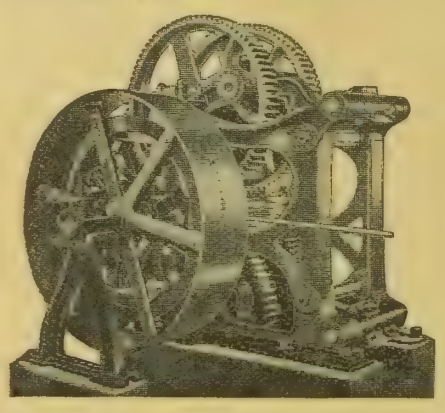
Endorsed by many of the largest irrigators in the State. Our pump catalog tells all about them. Fully guaranteed.

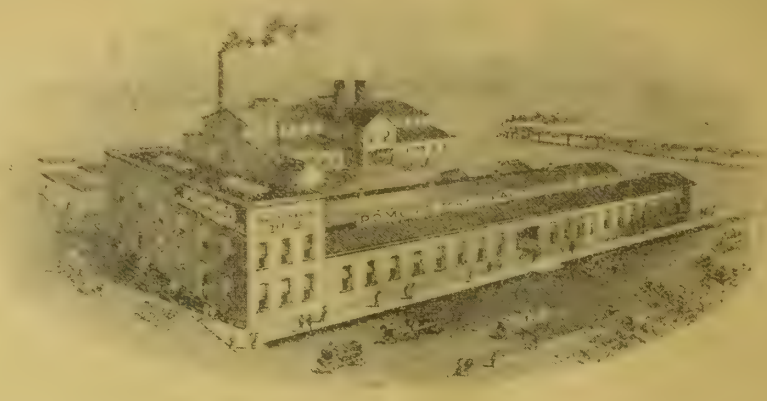
Pomona Double Plunger Deep Well Cylinders

Built in Ten Sizes

6, 7, 8, 9, 10, 11, 12, 13, 14 and 16 inches.
Also a full line of
Single Acting Cylinders.

Be sure to look into the construction of a Pomona Cylinder before buying.





The above cut represents in a measure the extensive plant of the Pomona Manufacturing Company, who are located in the central part of the largest irrigated district in the world irrigated from deep wells only. Started here ten years ago and have increased steadily until today are the largest builders of deep well pumping machinery in Southern California, and last but not least are not in business this season and out the next, but are here to stay, which ought to mean much to a prospective customer.

Write to us and tell us your needs and allow us to send you the name of some of your neighbors who number among our many satisfied customers.

Pomona Man'f'g Co.

Pomona, California

or

C. H. Weed, Porterville, Cal.

Agent for the San Joaquin Valley

Pomona Patent Pressure Gate

No rubber or wooden facing to rot or wear out. Absolutely water tight when closed. Locking mechanism is protected against rust or clogging with sand or dirt. Simple in construction. Cheap in price and as durable as solid iron.

THE LOCKING DEVICE

Is the simplest made, merely a tapering screw with split tapering nut socket. It locks the cover in any desired position or locks the faces, making an ABSOLUTELY WATER TIGHT JOINT.

TWO FOOT HANDLE FURNISHED WITH EVERY PRESSURE GATE FREE.

ALSO A FULL LINE OF CIRCULAR VALVES FOR ORCHARD AND ALFALFA IRRIGATION CARRIED IN STOCK.

Write for descriptive circular and price list.

Do It Right This Year and Note the Difference

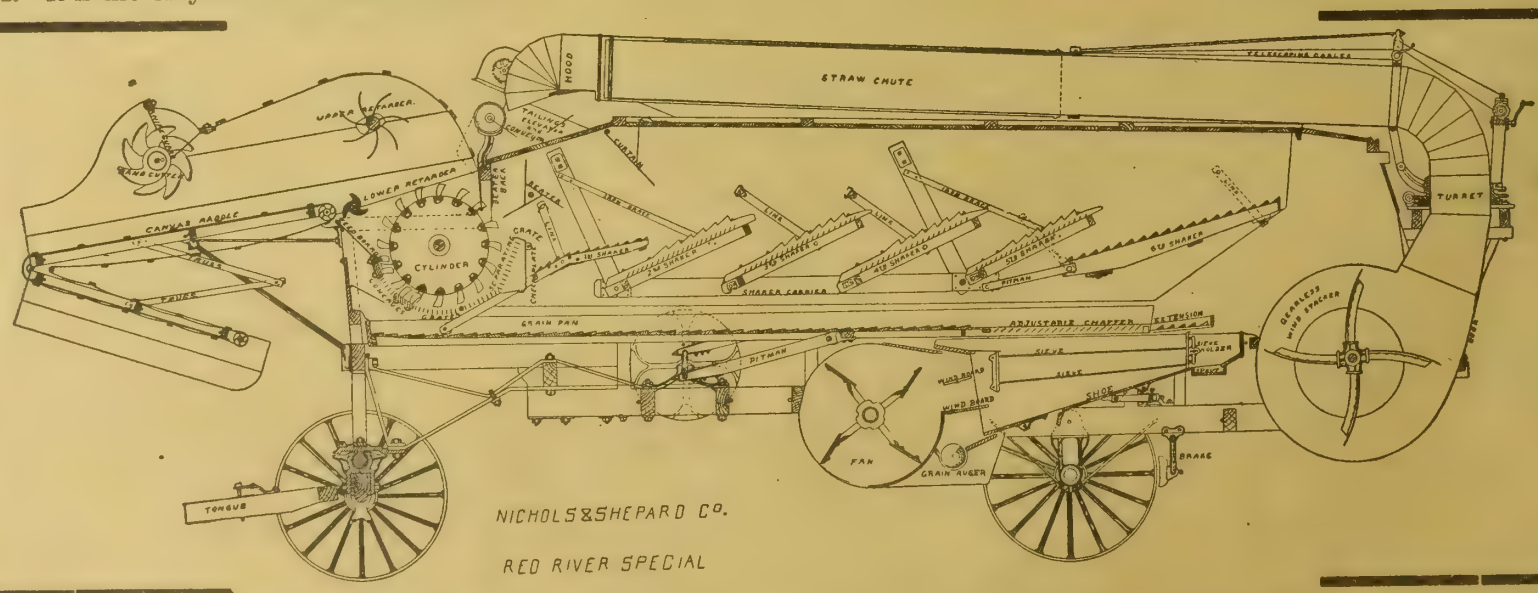
Buy a Thresher that uses the only correct method of getting the grain out of the straw and chaff. The **Red River Special**

BEATS THE GRAIN OUT

just as you would do by hand with a pitchfork. It is the only thresher built which does **beat it out.** If you were separating by hand with a pitchfork, you would not pitch the straw across the barn floor out of doors expecting the grain to drop out. Nor would you drag it around on the barn floor. You would toss it and **beat it** and keep **beating** it until you had **beaten** all the grain out. That is what the

Red River Speceal

does. It is the only thresher built which does.



The big cyclinder, the **"Man Behind the Gun,"** and the Separating Shakers **beat the grain all out** before the straw leaves the machine. The Farmer knows it and wants the Red River Special. The big jobs insist upon it. It will make you the most money. It will save the most grain. It will clean the best. It will thresh the fastest. **It will save the Farmer's thresh bill.** All because it doesn't wait for the grain to drop out: **It beats it out.** No other thresher does. Be up with the times and buy a **Red River Special.**

THE ARNOTT "Built-to-wear" LINE

OUR AUTO-SEAT SPECIAL.

Like other dealers, we sell an Auto-Seat Special. But we believe our Auto-Seat Special is better than the average—far better.

It possesses all the special features in shafts, wheel, gear and top construction that have made the "Built-to-wear" Line famous for strength and durability.

And in addition, the style of the auto-seat is far superior to others. In the first place, our seat has a hip measurement of from 1½ to 2 inches more than any other on the market, insuring comfort to the greatest degree. We make a feature of "leg-room" also, and the combination presents a job that is unexcelled; it hits every buyer in his most vulnerable spot.

Write for our catalogue and let us tell you more about this big leader, more about this quick-seller, this leading member of the "Built-to-wear" Family.

Write for catalogue showing the new line of Arnott "Built-to-wear" Surreys. Prices and styles will show you a new way to save money.

"BUILT-TO-WEAR"—that's the Arnott slogan. It represents the standard that, for many years, this concern has set for itself.

We've had to live up to it. Selling buggies that would last longer, look better and give greater satisfaction has been the one big thought during the course of this concern's up-building.

When other dealers were cutting quality in order to cut prices, when they were forsaking the old-time, thorough-going methods that meant strength and durability for new, and more or less slip-shod, processes in order to cut labor costs and reduce manufacturing costs and to gain a big out-put, this concern, believing honest manufacturing and an honest product to be more important than costs and retail prices, has gone ahead along its original lines and is selling work that honestly comes up to the "Built-to-wear" slogan.

We pay attention to the "little things" of buggy construction that other concerns pass by as unimportant, but which we know result in producing the kind of buggies that our grandfathers bought, and which lasted and gave splendid service for years and years.

The Arnott "Built-to-wear" Line is not behind the times—it is ahead of most other lines. In style, in new improvements it leads in every direction. But quality—good, old-fashioned, honest workmanship and materials are put into every job that those who buy may have more than one hundred cents of satisfaction for every dollar they invest.

Write us to-day for catalogue, prices and liberal terms.

The Sugar Beet Industry in California

By R. L. Adams

California has been called the cradle of the American beet sugar industry. In the production of beet sugar the early industry was obliged to force its way through adverse conditions and trying circumstances. But as greater information regarding the needs of the crop became available, and irrigation facilities replaced the necessity for relying entirely on the uncertain rainfall, the industry continued its forward march. Today California ties with Michigan for first place in greatest sugar production in the United States. In total production of sugar beets California takes second place. But this is probably but a momentary standing, as new factories in California should place her at the head of the list. And though the tonnage may be less, the sugar production is as great, thereby testifying to the great sugar making powers of California climate and soil. The higher sugar content of California's beets offsets Michigan's greater tonnage.

California's Factories.

Eight factories handle the California beet crop. These are situated at Alvarado, Los Alamitos, Spreckels, Betteravia, Chino, Oxnard, Hamilton City and Santa Ana. In addition, there are two factories at Visalia and Corcoran which are closed down at present. Two new mills will probably be completed in time for the coming campaign, one at Anaheim and the other at Huntington Beach. The first is capable of grinding 600 tons of beets per day of twenty-four hours, and the other 750 tons. Altogether the ten mills which will receive this year's crop total 11,850 tons of beets per day. Early estimates tend to show that California's eight mills produced a trifle more sugar than Michigan's seventeen during the 1910 and 1911 campaign, from a total tonnage of beets approximately 90 per cent of Michigan's.

Our Tonnage Too Low.

Statistics are usually rather dry reading, but possibly I will be pardoned for inserting a few to show California's standing in beet sugar production. The averages are for the four years 1907-1909 and are computed from the figures in the United States Department of Agriculture yearbooks:

State	Lbs. Sugar per Acre	Tons Yield per Acre	% Sugar in Beet	% Purity of Juice
Utah	4164	13.89	14.99	84.03
California	3809	10.60	17.97	83.65
Colorado	3264	11.24	14.52	81.03
U. S.	3165	10.12	15.64	84.45

In 1910 California planted approximately 87,000 acres to sugar beets, which brought to the growers the not insignificant sum of five millions of dollars.

Benefits Soil.

The sugar beet is an exacting plant to grow. Highly bred, it is very sensitive to neglect and will quickly resent such treatment by a reduction of yields or sugar content. Yet, on the other hand, if given proper conditions and attention the crop is a paying one to raise. The crop pays in two ways, first, financially, and second, by putting the land into vastly better shape for the crops which are to follow, whether they be beets, grain, potatoes, or beans. This last advantage is no mean one. The thorough preparation of the soil for the reception of the beet crop means a deep plowing and thorough stirring. The constant cultivation rids the land of weeds to a great extent. In the fall when the crop is plowed out the land is given the equivalent of a thorough subsoiling. The plant itself by its numerous tiny rootlets opens up lower stratas of soil and permits better soil aeration and moisture absorption. In dying these rootlets add a not inconsiderable amount of humus to the soil. Moreover, the plant in feeding brings up plant foods from deep down in the soil and stores them in the crown of the beet at the bases of the leaves. When this top is severed at harvest time it is left on the field at or near the surface of the ground where in decaying it liberates its collected stores of plant foods for the good of future, more shallow-rooted crops.

Best Methods.

Only good farmers make a success with the sugar beet. And conversely, when a man is seen to be making a success of his beets you may put him down as being a good farmer. Yet the profits from successfully grown beets are well worth securing, and of all the different aspects connected with the growing of the sugar beet none will repay better than an inquiry into the reason for the present low tonnage and a putting into practice of methods which will tend to increase the acre yield. A yield of 10.6 tons per acre is too low for California growers to be satisfied with. Utah raises 13.89 tons. California should be able to not only meet Utah's figure but to surpass it. The worst feature of the average is that many growers are getting a good deal more than this amount, so that in order to produce the average, there must be farmers who get less than the values of their services. A ten-ton crop just about pays for the cost of putting in, maintaining, harvesting and delivering the crop, the rent of the land, interest on the investment, and depreciation of stock and tools on a total acreage of 60 acres of beets. In order to make a profit the grower must either increase his acreage, still maintaining the same returns, or else increase the yield of his land. In some instances the first plan will work satisfactorily, but in the majority of cases the area which can be farmed to sugar beets is limited. Under such conditions greater acreage returns must be looked for. Of course, this ten-ton crop bears the cost of the services of men and teams which do the work. Many men, therefore, are satisfied to raise the crop for day wages. Others are willing to raise the crop for the beneficial effect on succeeding crops. Yet all growers no doubt are willing to increase their income from the growing of this crop. To do this greater acreage returns must be sought. A study of the better farming methods which underlie sugar beet culture will aid in bringing this about, as only through an understanding and practice of these principles can the greatest success be attained. All effort expended in gaining an understanding of proper soil preparation, seeding, care of crop, and habit of growth will be well repaid in increased tonnage returns, a result bound to bring joy to both grower and mill.

The Story of the Soil

Some months ago when the soil convention was held in the city of Los Angeles, the greatest disappointment was expressed by all attendants by reason of the fact that Dr. Cyril G. Hopkins of the University of Illinois at Urbana was compelled to leave on the opening day because of the serious illness of his wife. Dr. Hopkins, with Dr. King of the Wisconsin Station, had spent some days in visiting various parts of California to gather a fund of information as to soil conditions which were to form the foundations for his lectures to be given before the soil convention held under the guidance of the State Experiment Station. Dr. Hopkins' return home threw the burden of the whole convention upon Dr. King, but it was a most profitable one owing to his experience and the intelligence of those attending bringing up much which was not on the program.

Dr. Hopkins has written several books dealing with soils, which are classics. He has now issued another in a more popular form and so readable that the prosiest farmer will find it intensely interesting. The title is "The Story of the Soil" and it is written in the form of fiction. Dr. Hopkins says in the preface:

"Truth is better than fiction; and this true story of the soil is written in co-operation with the Press of America and in competition with popular fiction. The scenes described exist; the references given can all be found and verified; and the data quoted are exact, although some of the story dates antedate the scientific data."

The story opens with Percy Johnston, the hero, applying for accommodation at an old Southern home which was at one time a wealthy estate but now a summer boarding place. Percy is just from an agricultural college and has decided to dispose of a 40-acre high-priced farm which his mother owns, and purchase cheap, worn-out lands in Virginia which he may build up into a valuable property. He realizes the condition of these lands but goes over them and sends samples of the soil away for tests and in this way determines which offer the greatest opportunity for restoration to fertility. The mother of the boy is bitterly disappointed at his choice of a life calling; she has hoped that he would fit himself for some of the professions, but in the books which she has given him as an inspiration to greatest endeavor was a set of addresses by Abraham Lincoln, one of which delivered by Lincoln on September 30th, 1859, before the state agricultural society of Wisconsin, seems to the boy the greatest address Lincoln ever made, and to convince his mother of the wisdom of his choice of farm life he reads to her the address, part of which is quoted in the book. This address delivered more than half a century ago contains much that sounds familiar to those who attend farmers conventions and institutes today. It is so full of inspiration that we quote from it:

"Unquestionably it will take more labor to produce 50 bushels of wheat from an acre than it will to produce ten bushels from the same acre; but will it take more labor to produce fifty bushels from one acre than from five? Unquestionably thorough cultivation will require more labor to the acre; but will it require more to the bushel? If it should require just as much to the bushel, there are some probable, and several certain, advantages in favor of the thorough practice. It is probable it would develop those unknown causes which of late years have cut down our crops below their former average. It is almost certain, I think, that by deeper plowing, analysis of the soils, experiments with manures and varieties of seeds, observance of seasons, and the like, these causes would be discovered and remedied. It is certain that thorough cultivation would spare half, or more than half, the cost of the land, simply because the same produce would be got from half, or from less than half, the quantity of land. This proposition is self evident, and can be made no plainer by repetitions or illustrations. The cost of land is a great item, even in new countries, and it constantly grows greater and greater, in comparison with other items, as the country grows older.

"No other human occupation opens so wide a field for the profitable and agreeable combination of labor with cultivated thought, as agriculture. I know nothing so pleasant to the mind as the discovery of anything that is at once new and valuable—nothing that so lightens and sweetens toil as the hopeful pursuit of such discovery. And how vast and how varied a field is agriculture for such discovery! The mind already trained to thought in the country school, or higher school, cannot fail to find there an exhaustless source of enjoyment. Every blade of grass is a study; and to produce two where there was but one is both a profit and a pleasure. And not grass alone, but soils, seeds and seasons—hedges, ditches and fences—draining, droughts and irrigation—plowing, hoeing and harrowing—reaping, mowing and threshing—saving crops, pests of crops, diseases of crops, and what will prevent or cure them—implements, utensils and machines, their relative merits and how to improve them—hogs, horses and cattle—sheep, goats and poultry—trees, shrubs and fruits, plants and flowers—the thousand things of which these are specimens—each a world of study within itself.

"In all this book learning is available. A capacity and taste for reading gives access to whatever has already been discovered by others. It is the key, or one of the keys, to the already solved problems. And not only so; it gives a relish and facility for successfully pursuing the unsolved ones. The rudiments of science are available, and highly available. Some knowledge of botany assists in dealing with the vegetable world—with all growing crops. Chemistry assists in the analysis of soils, selection and application of manures, and in numerous other ways. The mechanical branches of natural philosophy are ready help in almost everything, but especially in reference to implements and machinery.

"The thought recurs that education—cultivated thought—can best be combined with agricultural labor, on the principle of thorough work; that careless, half-performed, slovenly work makes no place for such combination; and thorough work, again, renders sufficient the smallest quantity of ground to each man; and this, again, conforms to what must occur in a world less inclined to wars and more devoted to the arts of peace than heretofore. Population must increase rapidly, more rapidly than in former times, and ere long the most valuable of all arts will be the art of deriving a comfortable subsistence from the smallest area of soil. No community whose every member possesses this art, can ever be the victim of oppression in any of its forms. Such community will be alike independent of crowned kings, money kings, and land kings."

Citrus and Tropical Fruits

SUGAR CONTENT OF ORANGES.

By W. F. Sutherst, Ph.D., F.I.C., Bonita High School, Lordsburg, Cal.

Two of the most valuable crops have been developed to a certain shape in order to get out of them the highest yields; these are the sugar beet and wheat. It was found by analysis that in the former case the sugar was formed on the outer portion of the roots so that to get the maximum of this portion a long and thin beet was developed by selection; this adds to the labor of cultivation and harvesting, but pays in the end. With wheat it was found that the albuminoids were formed also near the surface of the grain and to produce wheat rich in this substance long and narrow grains were developed.

Why should not this system be applied to our fruits? Sweet oranges are naturally most desired by the consumer, and if an orange shape could be evolved to produce the maximum of sugar, a step in the direction of more profits would be made. With this end in view the writer carried out a number of analyses of Valencia oranges of varying degrees of ripeness, and dividing each into three parts estimated the amount of acid (as citric acid), grape sugar, and cane sugar.

The following results were obtained per cent:

I. Green. (Valencia Oranges.)

	Stalk end	Middle	Top
Acid	2.49	3.32	2.27
Grape sugar	4.16	3.87	4.00
Cane sugar	3.24	4.60	5.32
II. Middle Ripe. (Valencia.)			
Acid	2.41	2.66	2.13
Grape sugar	2.62	3.08	3.30
Cane sugar	2.54	4.82	5.34
III. Ripe. (Valencia.)			
Acid	2.57	2.61	2.06
Grape sugar	3.25	3.92	4.30
Cane sugar	4.73	5.45	6.02

From the results it is seen that (1) the acid decreases with age to a slight extent, with the larger percentage in the middle portion; consequently to produce a fruit with the minimum amount of acid, a long, narrow shape is required; (2) the grape sugar (glucose or dextrose) although the amount varies in different parts of the orange, the difference is slight and this particular not adding much to the sweetness, its use for this purpose can be neglected; (3) the cane sugar generally increases throughout the fruit with age, but is more highly developed in the top (navel end), as very little of this sugar is needed to increase the sweetness of anything, a development of this end would insure a sweeter fruit.

Further experiments will be carried out later with other kinds of citrus fruits, so that exact figures can be obtained, with a view to bringing out oranges of fixed shape and of the maximum sweetness. All the above work was carried out in the chemical laboratory of the Bonita high school on oranges taken from the neighboring orchards.

CITRUS IN ARIZONA.

Answering a question as to fertilizer and other features of Arizona citrus culture Burle J. Jones writes in the Progressive Farmer and Home Builder as follows:

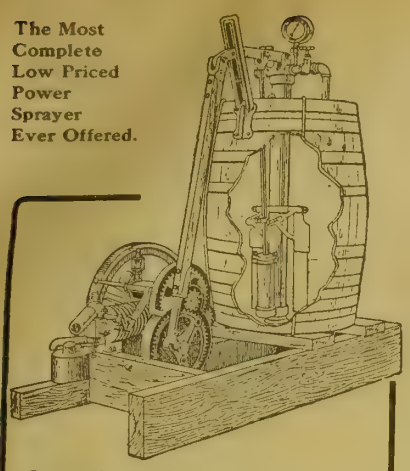
It is not absolutely necessary to use commercial fertilizers in our citrus groves. There are few here indeed that have ever had any consistent practice of this kind, and there are many twelve and fourteen years old that have never had a single application of commercial fertilizer. That these trees continue to bear fruit year after year, at the same time remaining healthy and making good vegetation growth is sufficient evidence that the soils are rich. But to be fertile any soil requires humus, and in this respect all arid soils are notably deficient, since the annual rainfall is not sufficient to produce natural vegetation in the necessary quantity to build up humus by its annual rotting. This being true it is of course also true that nitrogen is not present in abundance, and it is true that the other plant foods natural to these soils are not as readily or copiously available as they would be in a soil well supplied with humus. Even with this deficiency which nature has been able to provide, the soils of this valley are wonderfully rich and will bear abundant crops of any ordinary sort without any assistance other than that afforded by the application of water. They will raise good crops of the sweetest and finest oranges known without fertilizer, but we are urging our growers to keep in line with the best producers of these fruits, and to fertilize their groves to increase the yield, better the quality and perpetuate the industry. There should never be any rest in this sort of improvement. No matter how large the yield or how good the quality there is a chance to better it, and in adding fertilizers we are not only enriching the soil, but we are taking precautions to maintain fertility beyond our own times, increasing the availability of natural plant foods and increasing our own profits. The orange tree, being always green, nearly always with a burden of fruit in some stage of development, and therefore nearly always active, is a gross feeder and naturally exhausts soil fertility rapidly as experience in both California and Florida has abundantly shown. Nowhere, where large crops of good oranges are harvested will you find the community without a fertilizer practice, save perhaps in some restricted localities where they are in a silt soil and where the annual vegetable rot is enormous.

During the past few years fertilizer practice has gone ahead at enormous strides, but in the most progressive orange districts there is still much speculation and experiment. It is generally recognized as good practice to put on a pound of commercial fertilizer for every year in the age of the trees. That is, a tree six years old would be given a dosage of six pounds; a tree eight years old, eight pounds and so on. This is only approximate, but it makes a good practice and is sure to pay many fold if the mixture is right and the scheme is followed from year to year. In a nutshell, the question here as elsewhere is to make the trees bear the largest net per acre returns and at the same time to make a proper growth each year and increase their bearing capacity.

There are at present about six standard varieties of grapefruit bearing here, besides a number of seedling types shipped in from Florida whose origin or history are unknown. All of these mature to near-perfection in this climate. The time of ripening depends upon the variety. The Silver Cluster, Triumph and many of the unknown seedlings can be picked in November and December. The Duncan and Marsh Seedless come a little later, and some during the spring months. Any of them can be left on the trees after coloring from one to three months without deterioration, and will even improve in quality. It is desirable, where the trees are heavily loaded to pick a portion of the fruit when it colors leaving the balance until it is more desirable to remove it. There is one grove here which is noted for the enormous size and excellent quality of its fruit. It is not unusual for a single fruit to weigh five pounds. This sells at an average price of $2.00 per dozen at the orchard. Another which raises a smaller, but even more famous seedling fruit nets its owner $5.00 per box. Where the trees are properly pruned and shaped so that the fruit is protected by foliage there is not a year in ten in which the fruit will be injured by frost even when allowed to remain on the trees.

For general results there is probably no citrus tree better for orchard planting than a good yearling bud on three-year root that will caliper ⅝ to ¾ inch. Some prefer a two-year-old bud, and where these have done so well in the nursery as to caliper in

The Most Complete Low Priced Power Sprayer Ever Offered.



Gasoline Power Sprayer

Complete Ready to Operate

$92.50

Equipment includes Sprayer with Bronze Plunger, Gland, Valves and Strainer, large Air Chamber and Positive Agitator operating with each stroke of the Pump, all mounted in a Barrel, with 200 lb. Pressure Gauge, Water Relief Valve, and Gate Valve on Discharge; Air Cooled Gasoline Engine with Batteries, Spark Coil, Fuel Tank, 25 feet ½ in. High Pressure Hose, 8 feet Iron Pipe Extension with Cock, Brass Y and Two Mistry Nozzles. Uses only one pint of gasoline every three hours.

the neighborhood of an inch they are likely to do extremely well, but should be taken open roots and not balled, as that requires the cutting away of too many roots to keep the proper balance in so large a tree.

EFFECTIVE VEDALIA.

The report of the state insectary shows that less than 100 orders were received for Vedalia cardinalis during the past year. When one considers the billions of plants in California that are subject to attack by the fluted scale, this scarcity of orders shows what a marvelous hold the Vedalia has secured in this state. Perhaps the white scale has not been exterminated in a single locality throughout this range, and yet the work of its arch enemy is so effective that only 3,336 Vedalia have been called for in twelve months. It is now just a matter of sending an occasional colony of these ladybirds to relieve the trees from an outbreak of scale where from some cause the beneficial insects have allowed it to get a strong hold.—J. W. Jeffrey, in Los Angeles Times.

WHITEFLY IN TEXAS.

The Citrus Fruit Grower published in Texas reports that the Friendswood Nurserymens Association has taken up the fight against the whitefly and the association hopes to arrange for a power spraying outfit which will make a campaign. Plainly California has whitefly somewhat closer to it than Florida, and the fact that the nurserymens association is looking after a power spraying outfit doesn't look especially promising. The association should have tents in hand and give thorough fumigation for the control of this pest and wipe it off the earth before it is everlastingly too late.

TULARE GRANGE.

By John Tuohy.

After opening Tulare Grange, Patrons of Husbandry, the third and fourth degrees were conferred on a class of four, two brothers and two sisters.

A communication was received from a congressional committee with copy of bill to prevent the sale of articles which have been in cold storage longer than specified periods. The bill was referred to a committee of three brothers.

A communication from National Master N. J. Batcheldor was received, stating that where the master of the subordinate or Pomona Grange was unmarried, or the husband or wife of master was not a fourth degree member, only one alternate would be allowed to represent that Grange in the State Grange. All fourth degree members in good standing can participate in the work of the State Grange. Only masters, their wives or husbands, can vote.

Notice was received from the secretary of the State Grange that at the next session of the State Grange a change of the by-laws will be considered, changing the date of meeting of the State Grange from the first Tuesday in October to the first Tuesday in December.

The subject of the day was: "Which has the best chance of success, the rich or the poor man's son?" Mrs. Flora Sayre, to whom the subject was referred, read a well written paper on it. Success in every pursuit depends on love of the work, untiring application, industry, thrift and integrity; the necesisties of the poor man's son obligate him to think of this and apply himself to those qualifications that lead to success; the necessities of the poor man's son compel effort and diligence. The rich man's son rarely has the same application, he does not take advantage of his opportunities, he indulges in habits of ease, he spends more time in a life that unfits him for life's duties. The provident, successful father has been heard to reproach his negligent son for not more closely attending to the duties of his home, and tell him that when he was the son's age he had to work, to be industrious, thrifty and sober, to save and accumulate the means they now have; the son may well reply: "You were then compelled to work and thrift. I am not." The impression from the paper and discussion was that poverty

New Avocado Firm

Wm. D. Stephens, having a large stock of avocado trees, and I having the experience in successfully budding the same, it was thought advantageous to both parties to form a partnership, which we did and moved the stock to Whittier, where it is being rapidly converted into the finest budded trees in the land.

We have budding wood from the very choicest trees in the state: The Ganter, Walker and the Lyons. The Lyons is by far the best of any of the Southern California varieties. This magnificent tree is four years of age and producing over one hundred pounds of fruit. The fruit is average size and will weigh about one pound each. It has an excellent flavor, no strings and thick shell, so essential for shipping. We have the absolute control of the budding wood from this tree for a term of years, besides control of the finest and largest varieties that Old Mexico can produce. We are receiving numerous orders and booking same in their turn. Write for circular.

Deciduous Fruit Culture

THE PEACH APHIS.

By Prof. A. J. Cook.

Is it necessary or wise to dig out or cut down peach trees attacked by the black peach aphis? Decidedly no. It would be as absurd, in my opinion, to destroy the trees as it would be our citrus trees because they harbor the black scale.

The peach plant louse, Aphis persicae-niger, is well named, as it is black, and attacks for the most part the peach. As with many of our insects, we have much to learn of this insect, as we know not the eggs, the sexual forms, and so we cannot give its full life history.

It, like the wooly aphis of the apple, works on both the twigs and the roots. As it is on the roots much longer, it does more harm in the root form than on the twigs. Often the trees show lack of vigor, and we can see no reason, when if we could inspect the roots we would at once divine the cause of the decline. It is on the roots all the year, while it is on the twigs only for a short time in the early season. While on the twigs, some of the lice grow wings and fly to other trees. This and by planting trees that harbor the lice from the nursery explains how the pest is spread. If we destroy all the lice on the twigs, or even cut the trees, we do not destroy all the lice, as the forms on the roots are still existant.

The thing to do in case we find the lice on our peach trees, if they are bad (they are well scattered all over the United States) is to apply the same cure that we use for the wooly aphis. Tobacco decoction will kill the root lice, and may be used to destroy any lice that are on the roots of trees to be planted. One pound of tobacco will do for eight gallons of water. The lice on the twigs may be killed by use of a strong solution of whale-oil or fish-oil soap. A pound of soap will give strength to six or eight gallons of water. Often, as with most aphids, the lice will disappear, both the root forms and those above ground. Several insects prey upon these aphids. We repeat, do not destroy the trees, but treat them, kill the lice, and save the trees. Remember, the diseased trees are often sickened by the attack of the lice. Those on the roots are specially harmful.

CHEAPER PHOSPHATES.

Referring to comment in the Cultivator some time since as to cost of phosphate rock, ground, and answering our query as to its value in application to the soil, Mr. Ad. Tscheppe of Whittier, writes:

"The local price of $20.00 per ton for rock phosphate is hardly warranted as it sells for nearly half that price in England, and only shows that it has not yet become a commercial factor in California. The grade sold in Illinois is about the same, 62½ per cent.

"As to the time of availability of the raw rock phosphate I cannot answer from data of my own, and I have to refer to the literature contained in Hopkins 'Soil Fertility' and the admirable book of A. D. Hall of Rothamsted fame, 'Fertilizers and Manure.' Hopkins says that it is an absolute waste of money to pay much more for manufactured fertilizers than for the same thing in the raw material if properly ground to dust, and he states the difference in price in the following drastic manner: 'Twenty-five pounds of phosphoric acid (he reduces everything to elementary states of the respective materials, a mode much more simple, figures for oxides, etc., but so far uncommon) contained in 200 pounds of rock phosphate cost 75c, in the same amount of steamed bone $2.50, in 400 pounds of superphosphate $3.00, and $6.00 in the average complete fertilizer.

"Superphosphate reverts in the soil, mostly containing much more than sufficient calcium and magnesium-carbonates for the reaction, going to the insoluble or rather much less soluble state. What time that takes may differ with the various soils, but if a solution of superphosphate be percolated through a column of 8 to 9 inches of earth containing 3 per cent of calcium carbonate, the phosphoric acid is all absorbed during the short time it takes to make the experiment. Now it is an advantageous fact that the reverted (dicalcic phosphate) is more soluble in weak acids or water impregnated by carbonic dioxide as ground water always is. But the obviously striking effects of the finely ground Thomas slag above bones, which can only be ground to grit, demonstrates that availability can be obtained by mechanical means alone and that it is not necessary to subject the natural phosphates to costly chemical treatment, even for crops of short duration of growing to maturity. According to the laws for the regulation of fertilizer traffic in England this Thomas slag must be ground to such fineness that 90 per cent of it must pass through a sieve of 100 meshes to the linear inch. Unfortunately the low content of phosphates in Thomas slag forbids shipment to long distances, and its application is locally confined.

"Untreated phosphates must all be ground to dust to show immediate results. Raw bone which cannot be brought to any state of practical comminution has little effect on short-lived crops and is better applied after acid treatment. But short crops and evergreen are not in the same class. Nitrates and ammonia compounds are too quickly assimilated by the plants and too easily lost in the ground to be recommendable for the one yearly fertilizer application in orchards. Cover crops and slow nitrate producing animal refuse are undoubtedly preferable. Potash is said to become fixed in the soil and proved by the same experiment as the reverting of phosphoric acid to become less liable to be lost in drainage and yet constantly within reach of the roots if the one condition to be available is fulfilled, the adequate quantity of moisture. What larger quantities of rainfall and supply by irrigation in said sections are necessary for the diffusion of plant food in the soil may be illustrated by the following illustration: Bone phosphate is so little soluble that one liter of water only dissolves one milligram or one part in a million. Carbonated water will take up many times as much, and soil water always contains carbon dioxide in various proportions. One inch of rain produces nearly 225,000 pounds of moisture per acre or a rainfall of 17½ inches amounts to 4,000,000 pounds, which would only be able to bring four pounds of bone phosphate in solution. Irrigation gives 5000 cubic feet or 300,000 pounds, or nine irrigations of 1½ miner's inches bring again 4,000,000 pounds of water into one acre per year, or rainfall and irrigation together would be able to bring 8 pounds of bone phosphate in solution, which is not enough, as 600 orchard boxes of fruit per acre, a very moderate estimate, abstracts three to four times as much. So there must be agencies which increase the solubility of bone phosphate, be it carbon dioxide alone or exudations of organic acids from the rocks, alleged by some and denied by others.

"Experience through orchard experiments would take years. I apply fertilizer one year, my neighoor does not, under the plea that his trees bear more fruit without fertilizing than is good for them, he averaged 16 boxes per tree. His trees are oranges, mine are lemons, so the effect of fertilizing cannot be compared. But his slogan is plenty of water when they need it. He is right; abundance of plant food in the soil would be useless without it. Water makes the hills green and water conservation is the sole object of summer cultivation."

SELLING THE MERCHANTABLE APPLE.

Answering the question as to the best method of marketing the merchantable apple, Mr. A. N. Judd of Watsonville writes the Pajaronian:

"I would say that I approach the subject with great reluctance, as the

best way has an unsurmountable object in the way at present, unless the packers now handling the bulk of the crop in this section get together on the lines of the Southern Citrus Union.

"I talked with a number of the members of this union while down south, and find that they were anxious to have the growers and packers of this and other deciduous sections join them in their organization; using their sales agents (who cover practically every market center) to market our fruits. This plan would bring down the cost of marketing their products (which is 3 per cent on gross sales) by giving the sales agents a longer season to work, hence less monthly salary. Accordingly the cost of our sales would be the same amount, and a great saving would be effected all around.

"The advantages of the sales agency method over the broker plan are many. The broker is apt to confine himself to grades and varieties that sell easiest and neglect the harder selling kinds. He sometimes speculates at both ends of the line to the detriment of the packer and the buyer while the sales agent has to work hard for all classes and kinds of fruit in order to hold his job. He keeps you in closer touch with the markets, being on the ground, and above all he is constantly looking up new fields to conquer and this leads up to a matter that has been sadly neglected, the marketing of our bellefleurs. We read much about the northern grown "Spitz," their Newtowns and Winesaps at $1.50, $2, $3 and $4 a box, yet here we are with an apple without competition, superior in every way, that no country attempts to raise, yet this product does not find one-fourth the markets it should, and not half the price it should get, all on account of poor marketing conditions. One arrangement that would work wonders would be local cold storage. This would allow picking properly and at a proper time; would give ample time to market the same in the best markets instead of being the buffer for all the culls of the north and northwest in our only present market, the middle west. It would stop the present pernicious practices of selling half-grown bellefleurs that are tasteless and soon shrivel to the ruination of future sales during the season.

"The citrus exchange plan, whether by growers or packers, I care not which, and local cold storage, is the cure for many of our ills. Try it."

SIZE AND QUALITY IN FRUIT.

Increase in quality is not a necessary attendant to decrease in size, says a correspondent. Every fruit grower who stops to reason upon the question must recall the fact that "seedling" apples are usually small and very poor in quality. The fallacy of associating size and flavor, as of other supposed parallelisms, arises from the fact that individual instances have been widened into generalizations. We wonder at the smallness of the Russets, the Early Joes, the Delawares, the Seckels and the Doyennes, but we forget the Fall Pippins, the Hubbardstons, the Spys, the Greenings, the Brightons, the Anjous and the Boscs. But if it is a fallacy to associate increase of quality and decrease of size, it is perhaps a greater one to associate high quality with low color. Red is a very prominent character in all the fruits, and wholly green fruits, even among the apples, are rare.

STORY OF THE SOIL.

(Continued from Page 611.)

Dr. Hopkins adds: "Percy read these words as though they were his own; and perhaps we may say they were his own, for, as Emerson says, 'Thought is the property of him who can entertain it.'"

The boy's use of Lincoln's argument is sufficient to gain his mother's consent, and she denies herself and sends him to an agricultural college, where he fits himself for his 'profession." Percy concludes in talking to his mother: "Perhaps agriculture is not a profession, but I think it should be if the highest success is to be attained"; also "that no occupation is so uniformly successful as farming in its truest sense. It provides constant employment, a good living, and a comfortable home for nearly all who engage in it."

A bit of a love story runs through the book from the time when the hero meets Adelaide and concludes that "the eye is the window of the soul" and that he had never looked into such lovely eyes. He afterwards saves the girl from a couple of black brutes, who were lynched by the angry Southerners, which brings up the question of the color line, and a discussion of this problem takes up a few pages of the book. As a matter of fact, the book does not deal exclusively with the soil; but occasionally it gets so close to prosiness in the use of chemical symbols that one is liable to nod late in the evening, but the interest is bound to come back.

Anaheim reports the appearance of a new insect affecting the pear, walnut and grape.

Imperial Valley apricot marketing began the 8th of May.

Five Thousand Eureka Lemon Trees

For Sale

To be delivered in May, 1912, balled f. o. b. on cars Whittier, 55 cents each. Also one thousand 2 year old Navel trees for immediate delivery.

Address 209 So. Greenleaf Ave.
Whittier, California.

Why Experiment with Inferior Pumps?

Buy a pump built on the Pacific Coast, and adapted to your needs.

PEERLESS IRON WORKS
125-127 O St. Sacramento, Cal.

When writing advertisers, mention Cultivator.

THAT HEN

Can run out every day in the year on one of our small farms in the

Sacramento Valley, California

She can be kept cheaper and will produce more eggs than in any of the Eastern poultry States. Eggs sell as high as 65 cents a dozen in San Francisco during December and January. Over 10,000,000 dozen eggs were imported into the State during 1910. The local supply has never been over one-third the demand. The possibilities in poultry raising are unlimited. Your success depends entirely upon your efforts.

One reason why poultry raising is profitable in the Sacramento Valley is the fact that green feed such as alfalfa, forms two-thirds of a chicken's diet if given free range, and here on our small farms the chickens run out in the fields practically every month in the year. A hundred chickens may be carried on a 20 or 40 acre hog or dairy farm with almost no extra cost. An exclusively conducted poultry farm will yield a good income on the investment. And think how easy it is to purchase a farm in our great project.

$15 Down THAT'S ALL $11 a Year THAT'S EASY

To get the greatest profit out of poultry raising one should plant a few acres to Egyptian or Kaffir corn to supplement the feed from the alfalfa.

When you have investigated the costs and profits of poultry raising in the Sacramento Valley you will realize that in acres—

"Twenty's Plenty--- Forty's a Fortune"

The Sacramento Valley Irrigation Company has purchased and subdivided a number of the big bonanza ranches in the heart of the Sacramento Valley. A 20 to 80 acre portion of this great project is now offered to you at $125 an acre. $15 down and the balance spread over ten years.

Does Poultry Pay?

Gentlemen—In compliance with your request, I hand you herewith a statement of results obtained from January 1st, 1910, to May 31st, 1910, with one thousand hens. You will notice by the statement below that during the five months I have made a net profit of $940.17, or an average of nearly $1.00 on each hen.

Date	Doz. Eggs	Av. Pr. Per Doz.	Cost of Feed	Gross Receipts	Net Receipts
Jan. 1910	908	$0.35	$ 91.05	$316.04	$224.99
Feb. 1910	985	.26	106.75	256.39	149.64
Mar. 1910	1368	.21	98.75	284.09	185.34
Apr. 1910	1403	.23	102.25	324.75	222.50
May 1910	990	.25	88.80	246.50	157.70
	5654	Av. .26	$487.60	$1427.77	$940.17

C. C. MILLER, of Willows, Cal.

Would you want any better opportunity to own a California farm? If you are willing to work you win. If you expect to sit under a tree and have the dollars fall in your lap, we don't want you. The climate, soil and water are waiting for you, if you will do your share—COME. You will be a success.

Write today for full information.

When Butter-Fat is Low

You need more than ever the service of the best Cream Separator made—The

United States Cream Separator

First, because economy is absolutely necessary, and **you must get every bit of the cream from your milk.** The U. S. Separator is the **closest skimmer** in the world. It holds the **World's Record** for close skimming won in a contest of fifty consecutive tests, extending over 30 days, with the milk of 10 different breeds of cows. This is **no time** for you to use a cream-losing Separator.

Second, because high-grade cream and butter **are never a drug on the market.** The perfect skimming device of the United States Separator, **which has been washed and made absolutely sanitary in 10 seconds,** and is cleaned by **centrifugal force,** insures the highest quality product. **Easy cleaning** and **thorough cleaning** can be accomplished with the United States Separator in a space of time impossible with other Separators.

These two points (only two of many) make the United States Separator the **logical** purchase under present conditions. If you have any other kind of Separator, which should be discarded, our local selling agent nearest you will make you a **liberal exchange offer.**

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

FEDERAL MEAT INSPECTION.

By Geo. H. Glover, Colorado Agricultural College.

There has been a suspicion for a long time that we are suffering a severe financial loss from tuberculosis in our farm animals. Now we are in possession of facts gathered by the Bureau of Animal Industry and given to us in a report by Chief A. D. Melvin, which are startling in the extreme.

Of course, the saving of human life affords the chief motive for combating this disease, but, taken purely from an economic standpoint, we are suffering a financial loss which in the aggregate amounts to millions of dollars annually.

The facts given us by Dr. Melvin are gleaned from statistics of the federal meat inspection service, and are certainly interesting. More than one-half of all the animals slaughtered for meat during the fiscal year ending June 30, 1908, were inspected. There were, in round numbers, 54,000,000 animals inspected, and of these the following were found diseased with tuberculosis: Adult cattle, nearly 1 per cent; hogs, over 2 per cent; calves, very few, and sheep and goats, none.

The claim can no longer be justly made that the tuberculin test for tuberculosis is not reliable. A record of tests made with the government tuberculin for fifteen years reveals the fact that out of 400,000 cattle tested (mostly dairy cows) there were over 9 per cent of reactors, and of 24,000 reactors that were slaughtered, about 99 per cent were found tuberculous.

From all the statistics we learn that about 10 per cent of dairy cows in this country, 1 per cent of other cows and 2 per cent of hogs are tuberculous.

Of the economic loss from the disease we gain some idea by noting that there is about two and one-half millions of dollars annually lost on animals that are inspected at the abattoirs, and of course the healthiest animals are sold to slaughter, so that the loss from tuberculosis in all animals slaughtered for food is much more than five million dollars annually.

In addition to this is the economic loss in depreciation of value, loss in milk supply, loss in failure to breed and in feed for unproductive animals, which amounts in the aggregate to fully fourteen million dollars annually.

Many of the states are co-operating with the federal government in an effort to eradicate this disease; it is hoped that Colorado will do likewise.

CARE OF THE MARE AND FOAL.

By H. E. Kingman, Colorado Agricultural College.

The ideal condition for the mother, preceding the birth of a foal, is to have access to a pasture where she may be watched daily during the latter part of gestation. It is true that a mare may be worked up to the time of foaling, and there are instances of the colt being born while the mother is still in harness, but this is far from being a good practice. Severe exertion is a frequent cause of abortion, and at the best the young colt can not receive the proper amount of nutrition to make him grow if the mare is obliged to do hard labor.

A pasture gives the mother opportunity to take plenty of exercise, and if green grass is present, her bowels should be in good condition, which is highly important.

If it is possible, she should have a paddock or pasture by herself. Mules are especially annoying and frequently kill young colts. Other mares and even geldings may claim the colt and cause trouble. On the open range nature provides for this, all animals seeking seclusion during parturition.

Then, the green grass pasture is probably the cleanest place about the farm.

In case of storm, or where it is impossible to provide a paddock or pasture, a large box stall may be used. There should be plenty of clean straw, which may be sprayed with a weak solution of carbolic acid, say, a teaspoonful to a pail of water.

The colt should come fore feet first and right side up. If in any other position, there is something wrong, and the mother should be carefully watched so that help may be secured quickly if it is needed.

If the colt is born in the pasture and there is no reason to believe that the umbilical cord should become infected, then the cord should not be interfered with; but if other colts on the same farm have developed umbilical infection, or the colt is born in the stable or corral, then the cord should be ligated close to the body and the stump washed with a one per cent solution of carbolic acid. It usually pays to call a veterinarian to take charge of such cases.

Ordinarily, it is not best to bother the mother with your help or advice, but in extremely inclement weather the little fellow may be helped up and dried with a clean towel; better not at all than to use a dirty sack. Later, if he has trouble in finding his dinner you may offer some assistance.

The colt's bowels should move within the first twelve to twenty-four hours. Constipation is a very common trouble and may usually be relieved by an enema of warm water.

The mare's udder should be milked out for the first few days, if the colt does not take all the milk. Unless this is attended to inflammation of the udder may develop and check the secretion of milk, so that the colt will not receive as much as he should when he gains his strength.

Young mares sometimes refuse to allow the colt to nurse because of chapped teats, sensitive udder, or nervousness.

Do not try to drench a colt. If it is desired to feed the little fellow provide him with a bottle and nipple; there is great danger of causing mechanical pneumonia if pouring fluids into the mouth is attempted.

KEEP HOGS AWAY FROM THE MANURE PILE.

Investigations were made during the past year by the Bureau of Animal Industry of the Department of Agriculture to determine how much danger there is from exposure of healthy to tuberculous hogs. These investigations are not yet complete, but as far as they have gone it has been found that contact of healthy with tuberculous hogs in a hog yard is not nearly the dangerous source of infection that the exposure of hogs to tuberculous cattle or to the droppings of tuberculous cattle has been proved to be.

Some time ago the Bureau's Experiment Station at Bethesda, Maryland, proved that the commonest way for tuberculous cattle to expel tubercle bacilli is with their feces through their bowels. It was found that hogs exposed to the fresh manure of a herd of tuberculous cattle very rapidly became tuberculous. In this connection it seemed desirable to gain some information about the length of time that tubercle bacilli will remain alive and virulent in cattle feces, and especially in manure piles. Experiments made relative to this matter showed that tubercle bacilli die very rapidly on the exposed surface of manure, but that in the depths of a manure pile they may remain sufficiently virulent for months to cause tuberculosis in hogs that are exposed to the pile after a layer less than a foot thick has been removed from the surface. Hence, as in all the other work done by the Station on the vitality and virulence of tubercle bacilli, the fact is here again illustrated that the tubercle bacilli has an enormous amount of resistance to adverse conditions, provided it is not exposed to light or to a temperature which is high enough for the pasteur-

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.
Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

NOTICE OF STOCKHOLDERS' MEETING.

Notice is hereby given that the annual meeting of the stockholders of the Cultivator Publishing Company will be held at the Los Angeles offices of the company, 115½ North Broadway, Los Angeles, California, at 9 o'clock A. M. Saturday, May 20, 1911, for the purpose of electing the Board of Directors for the ensuing year and for the transaction of such other business as may properly come before the meeting.
R. M. TEAGUE, Secy.
Los Angeles, Cal., May 6, 1911.

ization of milk. While the investigation is not yet complete, officials of the Bureau of Animal Industry state that the tubercle bacilli, capable of causing tuberculosis in hogs, may live more than three months in a manure pile from a stable of tuberculous cattle.—Wisconsin Agriculturist.

PREPOTENT SIRE.

The following experience of the Missouri Experiment Station is instructive on this point:

A pure bred bull was purchased and used on a large number of cows, and it was found that the daughters were not producing as much fat as the dams. The average number of pounds of fat for the dams was 234, while that of the daughters would amount to 216. In six years this loss on 30 daughters would amount to $939. After these results were received a second bull was used to replace the first. This animal was much more prepotent in transmitting dairy qualities, and increased the average production of fat from 220 pounds in the dams to 280 pounds in the daughters. Instead of a loss this sire increased the value of the 30 daughters $2700 over that of the dams. Still a third bull was used and proved himself still more prepotent.

The cows on which this bull was used averaged 238 pounds of fat, while their daughters averaged 342 pounds, an increase of 104 pounds. The gain in six years on thirty daughters was $4950. This shows the importance of a good animal and demonstrates how a large number of the common herds are being ruined because of the ignorance or neglect of the owners.

THE PIGS' COMFORT.

I provide shade and shelter for my pigs by turning them into a wood pasture or the orchards, or by constructing a shed. This is done by setting some posts to support a roof of rough boards. The pigs seldom hurt the orchard if they do not run in it more than a month or two during the hottest weather.

Sometimes where there are but few trees in the orchard it is not best to let the pigs run there too long, as they may kill some of the trees by rubbing and gnawing them off.

If they start this, I turn them out and provide artificial shade. But I furnish them shade of some kind, and have abolished the dirty dry wallows.

Shelter is also needed at certain times. There are always a few wet and cold spells every summer when the pigs will suffer if they do not have good shelter, and they can easily get a setback during a cold rain that will take them a long time to recover from.—Journal of Agriculture.

WARBLES.

(Hypoderma Lineata.)

For grubs in calf's or cow's back squeeze out and destroy each grub; then bathe part with a two per cent solution of coal tar dip. Use same solution on legs and any other part of the skin that is not in normal condition. Feed an abundance of nutritious food.

When pigs are kept in cold, damp places during the winter months they often become rheumatic. They require warmer quarters than are usually given them by farmers or than are usually thought necessary. Medical treatment will do no good. Good care and proper housing are required. Give the pigs a good warm bed to sleep in and besides the skim milk feed them middlings and oil meal. Also keep charcoal, salt and ashes mixed together where they can get it at any time.

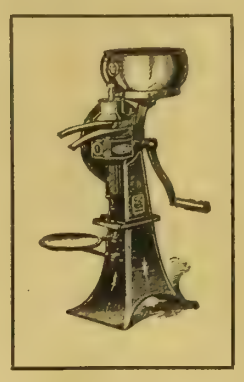
Ten tons of corn ensilage per acre is regarded by Experiment Stations as a reasonably conservative average, though fifteen tons per acre is a frequent yield under fairly good conditions of tillage, soil and seed. It is estimated by competent authority that this ensilage, when placed in the silo, costs about $1.95 per ton.

Who does the feeding when the team comes in from a hard day's work or a long drive?

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

TRADE in Your Old Separator for a New DE LAVAL

More than 15,000 users of inferior and worn-out cream separators of various makes traded them in last year on account of new DE LAVALS, and doubtless there are many more owners of such machines who will be glad to know that the DE LAVAL Company still considers it good business policy to make liberal "trade" allowances for them. While the old machines are worthless the demonstrated differences help the sale of many new De LAVAL machines.



Now that the flush of milk production is at hand, why not take advantage of this opportunity? See the nearest DE LAVAL agent, and he will tell you how much he can allow on your old machine toward the purchase of a new DE LAVAL. If you don't know a DE LAVAL agent, write to the nearest DE LAVAL office giving make, number and size of your present machine, and full information will be sent you.

Important to Users of Old DE LAVAL Separators

While DE LAVAL machines of ten or twenty years ago are much superior even to present-day machines of other makes, during the past few years many improvements have been incorporated in the present DE LAVAL machines that make them simpler in construction, easier of operation and cleaning, and more effective in skimming.

Liberal trade allowance will be made by any DE LAVAL agent for your old DE LAVAL toward the purchase of an up to-date machine. It will pay you to investigate. Any DE LAVAL agent will be glad to explain the new DE LAVAL improvements, or a DE LAVAL catalog illustrating and describing the latest styles and sizes will be sent upon request of nearest DE LAVAL office.

Small Fruits and Vegetables

CABBAGE.

The home gardener, the market gardener, and the truck farmer, each of whom contributes largely to the vegetable supply, is more or less interested in the growing of one of the most universally cultivated plants—the cabbage; and with its usual sensitiveness to the needs of its clientele the U. S. Department of Agriculture has recently issued a bulletin (Farmers' Bulletin No. 433) describing its cultivation under the different requirements of those three environments.

Although one of the coarser vegetables, cabbage finds a place in the home garden as well as in the market garden and the truck farm, and in some sections of the United States it is extensively grown as a farm crop. No adequate estimate, however, can be placed on the value of this crop, as it fluctuates very decidedly from year to year both in acreage and price; but the output is large—the three states of New York, Pennsylvania and Virginia, which outrank all the others, grow commercially about 50,000 acres of this vegetable, either as a spring or autumn crop, in addition to the home-garden supply which was consumed at home.

Early cabbage is practically all consumed as a green vegetable; the late crop on the other hand, is handled as a fresh vegetable, as a storage crop, and for the manufacture of sauerkraut. Cabbage is always in demand, and under present conditions, is always on the market either in the spring as the product of the southern farms, in the fall and early winter from the northern farm and market garden, or in the winter from the storage house where the surplus has been preserved for this demand.

A section of this bulletin is devoted to each of the three methods of producing the crop commercially—truck crop, market garden crop, and farm crop—and the influence of climate, extent of production, soil, fertilizer, seed, method of producing young plants, varieties, cultivation, enemies, harvesting, and marketing, is described and explained under each head, in accordance with the light and knowledge gained from experiments and experience.

TEST YOUR GARDEN SEEDS.

Very often the cause of a crop failure can be attributed to a poor stand. With the present high cost of living and the high price of land, we cannot afford to let soil lie idle, and that is just what some of it does when there is a poor stand of any crop on it. No matter how good the soil, the seed, the season, or the cultivation, if there is a poor stand the yield is decreased. A poor stand requires about as much time, work and expense in cultivation as a good one.

This is true in gardening as well as in other lines of crop growing.

An important factor in the cause of poor stands is poor seed. Seed may have its vitality or germinating power impaired from a variety of causes, such as lack of maturity, improper curing, or storing under unfavorable conditions. Very often the seed has spent itself germinating before it is planted, or perhaps it is too cold.

To avoid poor stands, seeds should be tested before planting. This is a very simple operation, and requires but a few minutes. There are several simple methods of testing seeds, probably most of which will answer the purpose.

One of the simplest and quickest ways is to test between blotting paper. First, count out 100 seeds of the kind to be tested, taking them just as they come and not picking out the best looking ones. Scatter the seeds between two pieces of blotting paper from four to six inches square and place in a common china plate and turn another plate bottom side up over the first. If pasteboard plates can be had, they are better, especially if a large number of samples are to be tested.

In this case all the plates containing samples of seed can be stacked up, each plate being placed right side up upon the one beneath. This makes each plate a cover for the one beneath it, and holds the blotting paper down closely to the seeds, preventing too rapid drying out.

The seeds should be placed in the living room to secure a temperature favorable to germination. Care should be taken that the seeds are not kept too wet, as germination takes place more readily under barely moist conditions. Strength of germination should be noted, for it is not enough that a seed germinate. It should germinate strongly to be a good seed. Seeds which germinate weakly in such a test may not be strong enough to make a good plant under field conditions.

If moulds form quickly on the seeds, they are likely to be old stock.

If 100 seeds are taken, the number that germinates can be taken as the percentage of germination. If scant, the seed should not be planted. If good, or indifferent, it may be planted, making the proper allowance for seed which will probably not germinate.—S. Van Smith, Colorado Agricultural College.

QUARANTINED POTATOES.

About the largest single batch of trouble the State Quarantine Office has ever endured has now reached its climax through the shipment of about a dozen carloads of infected potatoes from Nevada. These potatoes are being intercepted all over the north and the incident keeps the wires warm with questions of horticultural law and replies directing that the potatoes be sent out of the state or destroyed, at the option of the shippers.

Over two months ago the first lot of infected potatoes was captured at the Sacramento depot. The potatoes were badly infested with the eel worm, and the lot was sent back to Reno. In a few days the same lot, transferred into another car, appeared in Los Angeles in charge of the owner, who stated that he heard the state commissioner of horticulture was a resident of Los Angeles and that no doubt some arrangements on that account could be made that would let the potatoes go on the market. I have not heard that any such arrangements were made.

Since the first car was received these tainted potatoes have been coming right along. Two carloads were intercepted at San Francisco and sent back. The last week of March three carloads were sent to Bishop, and Independence, the shippers no doubt thinking that the law would not be invoked in faraway Inyo County. But a deputy quarantine officer caught them all and sent them out of the state. It seems that at least 25 per cent of all Nevada potatoes received in our state this season have been infested with the eel worm, but as we have no data upon the total shipments from Nevada, the percentages may have been less. But this we know, that a large area of fine potato land at Dayton has become permanently infected with this soil pest. With thirty-seven new quarantine guardians and their inspectors numbering over a hundred, such perils as this should be effectively excluded.—L. A. Times.

The Ornamental Garden

LANDSCAPE GARDENING AND RURAL HOMES.

By Professor Arthur L. Peck, late of Oregon Agricultural College.

Thoroughly to understand and properly to appreciate landscape gardening, one must be familiar with a few of the basic principles of the art and also know what we mean by the term "landscape gardening" in the first place. It has been defined by a well-known writer as the arranging surfaces of land and water, with all forms of vegetation they support, and all such forms of architecture and sculpture that may be thought desirable according to some settled scheme or idea. Landscape gardening is a fine art, and is properly placed with painting, sculpture and architecture. That is a fine art which attempts to create organized beauty, to unite several dissimilar parts into one organized whole.

Granting, then, that any landscape composition may be criticised with reference to rules applicable to the other arts, we would expect to find certain similar artistic qualities in all branches. One of the most important of these qualities is "unity." Unity in a landscape composition means that some one idea shall prevail throughout, and that all details shall be subordinate to it. To attain this unity one must subject all his ideas to one of the two general styles of treatment —known as the "formal" and the "natural." The former is characterized by the presence of the straight lines, geometrical forms, architectural features, plane surfaces and sheared or regular forms of trees and shrubs. It is sometimes called the "geometrical" or "architectural" style. In the "natural" style we find irregular curved lines, broad, sweeping curves in the surfaces; irregular grouping of trees and shrubs, irregular skylines, and the absence of all things which pertain to the architectural. Country homes, surrounded as they are by nature's general treatment, should be laid out along natural lines. City squares, str t parkings, plazas and other limited areas closely associated with large buildings, should be treated along formal lines.

With these general principles in mind, let us take up the problem of properly arranging the home grounds so that when the work is complete the grounds and the house, taken together, will present to the observer a harmonious, pleasing picture.

The first of all to be considered is the convenient arrangement. The most beautiful home or garden is not good if the convenience of the owner is sacrificed. Drives and walks should be laid out so that they will be useful. They should be direct and have good grades and if curved, the deviation from the straight lines should be justified. This can be done by taking advantage of the natural contours of the ground, or by platting in such a way that it comes very natural to make a detour around the obstacle. Straight lines are many times justified, and unless the distance and other conditions warrant it, should be used.

The foundation of the entire work is the lawn. It should be broad, well graded and well kept in some instances; and should be framed on either side by interesting grouping of foliage. Generally speaking, the lawn planting should be carried to the side, or at least, related to the border planting, if specimen trees are used. In many farm homes a broad mowing, or meadow, in front of the house is very attractive. In that case the grass should be cropped only in close proximity to the house. The effect of this grouping of foliage on the sides is to frame the home picture, and to set off the house to the best possible advantage.

In arranging planting it is worth while for one to study the works of nature. Note the following outline of young fir growths as they creep into the clearings. You will find that line is irregular, deep bays showing here and there, separated by strong, massive projections. Oftentimes there will be an individual or two standing out from these strong masses. The straight line is entirely absent, while the outline of the foliage presents long graceful curves. In choosing the materials to be used, locate the coarser texture of the foliage further from the house, and as you approach the home the shrubs and trees should be finer and be able to bear a closer inspection. Fine flowering shrubs and vines should be used close to the home, and these serve in a way to tie, or to unite, the building with the grounds. Care should be taken, however, not to plant too heavily around the foundation or the appearance of soundness and stability will be lost, because one can get no idea of the foundation upon which the structure rests.

It is the desire of most men to have their grounds appear as broad and extensive as conditions will allow. Whenever we introduce into the lawn such things as circular beds, rose hedges and other forms of brilliant flowering plants, we decrease the apparent extent of the area. Locate all herbaceous flowering plants and roses by themselves along the shrubbery border, or possibly near the entrance of the vegetable garden. Here they can be well cared for, cut and taken into the house or allowed to mature and die down without seriously affecting the appearance of the complete picture.

The use of materials is a complicated subject in itself and time forbids my taking it up in this paper. I would like to say, however, a few words in favor of our native plants. The flora of Oregon is very rich in shrubs and trees of ornamental value. Among these I might mention Oregon grape, red flowering currant, mock orange, red-twigged dogwood, waxberry, mountain spray, nine bark, sweet briar, rose, azalea, mountain lilac, rhododendron, madrone, chinquapin, flowering dogwood, hemlock, cascara, numerous conifers and many others. These plants all do well in cultivation and make beautiful specimens, especially when planted quite small.

So much for what can be done in beautifying the home grounds. It is very easy, however, for a lover of plants to seriously overdo the matter. Do not feel that you must have everything you see to which you take a fancy, and in general, it is a good thing to avoid what we call "horticultural freaks." We do not want to make a museum of our home grounds.

Things brought into close association should be congruous and kindred in character. Rookeries and rustic work too near the home are hardly logical, one suggesting the wild and the picturesque, the other art and the works of man. The well-known tripod and kettle filled with flowers is another example of the incongruous. Seashells for edging flower beds far removed from the ocean, decaying fir stumps in the midst of a well-cared-for lawn; iron dogs, or stags amidst similar surroundings are other irregularities which one so often sees, and which are much better left out of the composition.

Much has been said with a view to urging amateur landscape gardeners to pay more attention to the arrangement of the trees and shrubs on the home ground; to bring them to the point where they will realize that small compositions require just as much study as large ones, and to encourage those who feel that financial conditions bar them from developing attractive home grounds. In bringing these remarks to a close I wish to quote Mrs. Van Renasselaer, one of our most artistic writers on the subject of landscape gardening, presenting for your consideration her idea of the application of the subject under discussion. She says:

"If now we ask when and where we need the fine art of landscape gardening, must not the answer be, whenever and wherever we touch the surface of the ground and the plants it bears with the wish to produce an organized result that shall please the eye? The name we usually apply to it must not mislead us into thinking that this art is needed only for the creation of broad 'landscape' effects. It is needed wherever we do more

(Continued on Page 631.)

DWARF KAFFIR CORN for DRY LAND

No better fodder and grain crop can be planted on dry or alkali and than this prolific member of the Sorghum family. This dwarf variety possesses the advantages of more foliage, smaller stalk and ease of harvesting. Its great root system enables it to produce wonderfully in drought sections, and breaks up new ground for other crops.

FOR STOCK FEEDING

Dwarf Kaffir Corn will produce 10 to 15 tons of green fodder or silage to the acre, or 5 to 8 tons of dry fodder.

FOR POULTRY

The grain is a valuable food for poultry and will crop 2,000 pounds and upward per acre.

Write for cultural directions and price.

Please mark letter Dept. C

Germain SEED & PLANT CO.

ESTABLISHED 1871

SEEDS—NURSERY STOCK—POULTRY SUPPLIES.

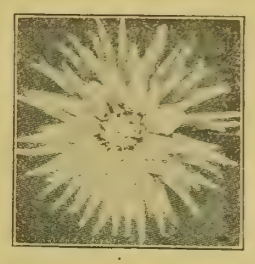
LOS ANGELES, CALIFORNIA.



Dahlias

From one of the largest collections in America you have the privilege of selecting when you have our catalogue.

The cream of the best Sweet Peas, California Poppy, Yellow Calla Lily. The newest and best of everything in California Flowers.

Dahlias We want you to know more about our collection and we make this offer to mail to any post office in the United States.

TEN DAHLIAS FOR $1.00

Your selection as to whether they shall be Cactus, Decorative, Show, Single or Assorted. Our selection as to varieties, all with correct names, mailed to you for $1.00.

LEEDHAM BULB CO.

SANTA CRUZ, CALIFORNIA

Dwarf Milo Maize and Red Kaffir Corn

The two great drought resisters should now be sown. There is no more profitable dry land crop than these two members of the sorghum family. We have taken particular care in selecting acclimated seed stock of the true dwarf varieties, yielding two to three tons per acre. Write for samples and cultural directions.

WEST COAST CHICK FEED

They can't beat it. Nothing better for the little ones. 100 pounds, $3.25. If not sold by your dealer, we pay the freight within 100 miles.

WEST COAST SEED HOUSE

111, 113, 115 WINSTON ST. between 4th and 5th near Main. LOS ANGELES

Orange Seed

Now is the time to start your Orange Seed Beds. We are prepared to furnish you with Fresh Orange Seed that will produce strong, healthy Seedlings. Ask for quotations, stating quantity required.

MARKET GARDENERS: We make a specialty of catering to your trade and are always ready and glad to help you select those seeds best adapted to your requirements.

NURSERYMEN can find in our Store everything they need in the way of high-class Tree and Plant Seeds as well as other supplies such as Raffia, Budding Knives, Imported Sprinkling Cans, etc. And don't overlook our "Non-Kinkable" Garden Hose if you wish to avoid the constant repairing that the old kind requires.

CONTENTS THIS WEEK

A HAT FULL OF FRUIT, Cover.

SUGAR BEETS IN CALIFORNIA, 611

THE STORY OF THE SOIL, 611.

CITRUS AND TROPICAL FRUITS—Sugar Content of Oranges; Citrus in Arizona; Effective Vedalia; Tulare Grange; 612, 613.

DECIDUOUS FRUITS.—Peach Aphis; Cheaper Phosphates; Selling Merchantable Apples; Size and Quality of Fruit; 614, 615.

LIVE STOCK AND DAIRY.—Federal Meat Inspection; Care of Mare and Foal; Keep Hogs from Manure Pile; Prepotent Sire; Pig's Comfort; Warbles; 616, 617.

VEGETABLE GARDEN.—Cabbage; Test Your Garden Seeds; Quarantined Potatoes; 618.

ORNAMENTAL GARDEN.—Landscape Gardening; 619.

EDITORIAL.—Beautify Roadways; Overproduction; Pure Food Judgments; Coast Nurserymen; Correction; 620.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 621.

PRACTICAL POULTRY CULTURE.—Canaries; Duck Raising; Market Eggs; 622, 623.

QUERIES AND REPLIES.—Soft Brown Scale; Renewing Blackberries; Bordeaux for Mildew; Mortality of Incubator Chicks; Brown Spots on Fig Leaves; White Scale; Fumigation vs. Scutellista; Chuckawalla Valley; Three Queens in Hive; Potash on Orange Trees; 625, 627.

HOUSEHOLD.—Will and Bess; Story of the One Cent Lady; Selling by Appearance; Rhymed Recipes; Decay of Manners; 628, 629.

VETERINARY.—Cough; Garget; Teat's Orifice Contracted; 631.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market; 632, 633.

Florida orange people claim an increase of 300 per cent in output during the past ten years. Lemon culture does not show such an advance; twenty years ago that state made a claim of 20,000 bearing trees and 80,000 nonbearing; last year the crop was only 7,000 boxes, from 5,000 trees.

BEAUTIFY THE ROADWAYS.

The Sacramento Bee refers to the fact that the municipality of Everrett, Massachusetts, will pay one-half the cost of tree planting along any of its streets. The Bee adds a criticism of the plan on the grounds that every citizen of a community should have sufficient pride in its appearance and in the uniformity of its streets to unite with neighbors and plant trees without any chromos being thrown in. It truthfully says:

"Trees are a valuable asset to any city. Their number on the older streets of Sacramento, the pictures and the shade their spreading branches afford, make this city distinctive. Without them this would be a bare and unattractive place, and the streets far less comfortable during the summer months."

Notwithstanding which it must be confessed that less than half the people seem to appreciate that fact. We have never yet witnessed an effort at public improvement without a vigorous kick from those who are to be benefited, because of cost, unacceptable plans, or some similar excuse.

This is true of the cities and equally true of country districts. Riverside has solved the problem through the work of a most enthusiastic tree warden, but, unfortunately, few sections have a J. H. Reed to impress upon all the advantages secured from beautifying roadways. These advantages are not simply in increasing valuation of real estate. If so, it would give some cause for the opposition of people who, having no desire to sell, claim that the only result is increase in taxes. But far beyond increase in money value, beautiful surroundings bring a higher grade of people to a community, which means better social conditions, and better social conditions mean much to the family of the producer as well as to the family of the city dweller.

The city of Riverside was not spared opposition to improvement, but it is gradually being overcome, and street tree planting is becoming the habit and the pride of that section. Nothing else offers such great returns for expenditure as roadside improvement, and all sections, whether in city or country, should consider the matter.

OVERPRODUCTION.

With our 40,000 or 50,000 cars of citrus fruits going out this season, and with planting continuing unabated, more talk than ever is made of possibility of overproduction. Yet when we consider the number of acres which are going out of bearing, either from town lot subdivision or neglect; also the prices received for the fruit this year, the greatest of all years in citrus shipments, there seems some little ground for the belief that California is far from producing too much citrus fruit. Granted, that we are producing too much low-grade fruit and marketing some of the high-grade to poor advantage, yet, with twenty-six thousand cars of oranges already shipped, every one bringing good returns to the shipper, we are justified in the belief that the industry will remain as profitable as it has been for the past few years. Always there remains the question of tariff and general financial conditions of the country, but these confront every industry, and there is no profit in anticipation.

It is estimated that Riverside County has 350,000 acres yet to come into bearing, Los Angeles 350,000, Orange 325,000, San Bernardino 200,000, and Tulare tops the bunch with a claim of 800,00. This means an enormous increase, but we have heard this overproduction talk in California for more than twenty-five years, and are frank to say we do not hold pessimistic views of the citrus industry.

PURE FOOD JUDGMENTS.

In a big bunch of "notices of judgment" under the food and drugs act which recently came to this office we note one stiff fine, afterward suspended, for the misbranding of "pure olive oil" which upon analysis was shown to contain more than 75 per cent of cotton seed oil. Cotton seed oil is all right, but, branded as olive oil, all wrong.

Another judgment was for adulteration of olives found "to consist in large part of decayed, wormy and shriveled olives with rancid oil." This victim was fined $25, and the sentence not suspended. Certainly he got off easy.

A package of figs was condemned because it contained "97 per cent of filthy, mildewed and decomposed figs." This judgment does not show any fine imposed, but the figs were destroyed.

Ladle butter also came in for certain findings; one package containing "gas-producing organisms and bacteria of the B-coli group." We confess ignorance of that particular group, but it doesn't look good to us. In this bunch of foul butter were seventy tubs. The product was seized and, after condemnation, forfeited.

COAST NURSERYMEN.

George C. Roeding, of Fresno, who is president of the Pacific Coast Nurserymen's Association, informs us that plans are hatching for one of the most interesting sessions of the association ever held. The convention will be opened in San Jose June 21, and will continue three days. Secretary Joseph T. Brooks, of the San Jose Chamber of Commerce, is pushing things locally to have something doing every minute. C. A. Tonneson, of Tacoma, Washington, is secretary-treasurer of the association, and can give information to nurserymen who may wish to know more of its workings.

CORRECTION.

In the article, "Some Fundamentals," by Mr. J. B. Neff, in the irrigation number last week, an error was made in the sentence: "About five acre-inches is needed for oranges, and from five to ten inches more for lemons." This should have read: "About twenty-five acre-inches is needed for oranges."

In an endeavor to impress upon its readers the fearful loss of moisture from uncultivated soil, an Eastern paper makes this statement, referring to lands saturated by recent rains but not cultivated: "It will take 750 teams constantly hauling water for one week on a quarter section of land to restore as much water as will evaporate in that same week under those conditions. That evaporation can very largely be prevented by thorough tilth."

The thirty-sixth annual convention of the American Association of Nurserymen is to be held at the Southern Hotel, St. Louis, Mo., June 14-16. Membership in this association costs $5, for which the privileges of the association are granted, including badge book. The serious discussions will be supplemented by various side trips, taking in the 3,200 acres of city parks and the Missouri Botanical Gardens, one of the most famous parks in the world.

One of the most consistent believers in green manuring, or more properly "brown manuring" is Mr. Gerald Geraldson, of Newcastle, Placer County. While in Los Angeles recently, disposing of a bunch of those excellent figs he processes, he dropped in to convince us that the only way to take humus into the soil is to allow the native grasses to have their own sweet way for an entire season in half of his orchards. The other half, or each alternate row, is kept well cultivated. The following rainy season the dry weed stalks are plowed under. Mr. Geraldson's idea is that these dried weeds contain cellulose, which makes humus, whereas the plowing under of succulent growth turns back into the soil practically nothing but water. In any case, Mr. Geraldson insists that we must have humus, and in that the orchardists of the state are with him.

The "discoverers" of dry farming are endeavoring to impress upon Californians the desirability of introducing that practice into their state. These people are usually theoretical "farmers" who haven't yet absorbed the idea that California was in the dry farming class long years before they began to spring their theories on the public. These theorists, some of them, are so extreme that they do more harm than good to the cause of dry farming. Misstatements are so attractively put that ignorant people rely on dry farming to accomplish impossible results. Dry farming is all right, but its practice requires more intelligence than many writers on the topic possess.

The American Lands and Irrigation Exposition management is making arrangements to award "the handsomest and most valuable prizes in the history of American agriculture" at the exposition to be opened in Madison Square Gardens, New York City, on November 3. Exhibits are assured from Alaska and Canada, and the government of Mexico has promised to make a display of its agricultural products.

Percheron breeders are elated over the great showing made by their favorite breed in the imports to this country. The total importations of the one breed exceed those of all other breeds of draft horses combined. Illinois leads, with 2,237 animals imported during the year 1910; all other pure-bred draft sires aggregated 1,131.

As wonderful a plant as alfalfa is for the stock grower, it is not a typical pasture plant; it may hardly be called a pasture plant at all. In Imperial Valley, where it has been used for pasture, great care is taken not to allow stock on it after watering; even then it proves short-lived.

The retail grocers of Columbus, Ohio, are pushing before their state legislature a bill calling for the selling of all products by weight. This includes eggs, fruits, etc., and is an entirely new departure for that section.

Assembly Bill No. 946, passed and duly signed, permits county boards of education to pay for transporting children from remote sections to a central high school. We trust this will result in increasing the popularity of this plan.

France reports a failure in its crops of wheat, potatoes and wine grapes. The first two will be imported during the coming year, wheat to the extent of over eighty million bushels.

Agricultural News Notes of the Pacific Coast

Northern California

The regular annual cannery picnic will be held at Gridley June 2.

Almond buyers manifest a willingness to sign contracts at 14 cents.

Dairymen at Red Bluff anticipate the early establishment of a creamery.

Irrigation ditches near Live Oak, Sutter County, are being extended.

Durham, Butte County, finds almonds but little injured by the cold.

Nevada County contemplates the drainage of several thousand acres of richest lands.

An Oakland man has filed on 40,000 inches of the Feather River near Biggs, Butte County.

San Francisco people are urging that the Panama-Pacific Exposition be kept out of Golden Gate Park.

Acreage of sugar beets in the Sacramento Valley will be materially increased over that of last year.

Dairy people of the northern coast counties are pleased at the signing of the dairy bill by the governor.

Sheep owners near Petaluma have had many pure-bred sheep destroyed by dogs during the past few weeks.

The Chico Alfalfa Meal Mill Company has filed articles of incorporation; it is capitalized for the sum of $25,000.

The cold weather which has prevailed all spring over the Sacramento Valley is responsible for lateness of vegetables.

The pure-bred stock on the University Farm at Davis was put on exhibition during the annual farm picnic last Saturday.

Three thousand acres of the Fair Estate in Alameda County have been purchased and will be subdivided into small holdings.

Commencement exercises of the first class to go forth from the University Farm School were held Friday afternoon, May 5.

Some Sacramento Valley apricot growers predict 17 to 20 cents as the price of dried apricots before the end of the drying season.

Orland is preparing for a big irrigation jubilee to celebrate the opening of the government irrigation project; it will be held in June.

A pump thrownig a stream two feet in diameter will be installed near Princeton, Colusa County; it will irrigate a large tract of land.

Buyers of Thompson Seedless at Yuba City are more anxious than ever to close contracts, and have increased offering price to $20 per ton.

The Eldorado County Fruit Alliance held a meeting at Placerville last week and perfected organization for handling the coming fruit crop.

The third annual basket picnic at the University Farm was the usual success; it is estimated that over 2,800 people were on the ground.

The ground on which the famous orange tree at Bidwell's Bar, Butte County, stands is to be deeded to the county and preserved as a historical landmark.

The State Agricultural Society met in Sacramento recently, and C. H. Telfer was elected to succeed J. A. Filcher, who has filled the office of secretary for years.

Central California

Steps have been taken to form a Tulare County Poultry Association.

Santa Cruz County reports a good crop of apricots despite adverse conditions.

A berry special has been put on by the Southern Pacific, leaving the Pajaro Valley each day for San Francisco.

It is proposed that growers sign an agreement that only such fruit as will pass inspection may be sent out of the state.

Owing to the dry season, apple scab has not yet appeared in the Pajaro Valley orchards; mildew, however, is developing.

At a meeting of fruit growers held in Lindsay recently a standardization scheme with compulsory inspection was suggested.

A petition is being circulated in Kings County asking for the calling of an election to vote upon the question of good roads bonds.

Orange planting in the Plano district, Tulare County, shows greater activity; lands in that section are now commanding $125 per acre.

Harvesting of grain in the San Joaquin Valley will be at least two weeks later than usual; the crop will not be quite as large as in the past.

Horticultural Commissioner Volck of Santa Cruz County reports that the early spring spraying with arsenicals in the apple orchards is materially greater than any past season.

East Side farmers near Stockton are discussing plans for construction of a private levee which will divert storm waters from their holdings.

The irrigation and reclaiming of a large tract of land near Alpaugh, in southern Tulare County, is to be taken up by a corporation recently perfected.

The Fresno County Fair Association has elected a new secretary and is planning for one of the best fairs ever this fall; the racing program is already arranged.

Commissioner Schulz of Tulare County is continuing his fight against mistletoe, maintaining that it is harboring scale insects which later infest orange and olive trees.

Fresno reports over 2,000 tons of raisins in the hands of the growers. Packers are reported well stocked. It is thought the holdover will readily command 4½ to 5 cents.

The bonds of the Tipton irrigation district were canceled at the First National Bank, Visalia, on Tuesday, May 2. A public burning of the bonds and a celebration is contemplated.

Wood choppers have been found taking away valuable old live oak and other trees from the roadsides near San Jose. The Outdoor Art League of the county is looking up the matter and proposes to stop the vandalism.

The Farmers Union of San Jose held a meeting recently for the purpose of discussing the orchard help question, and remained by the position formerly taken that the school children of the country should be released so as to be of help to the fruit-growing interests.

Southern California

Brawley is shipping about 100 crates of summer squash daily.

Ventura reports hay and grain very short all over the county.

A Coachella Valley chili pepper grower is netting 25 cents a pound.

Tomatoes are being shipped in large quantities from the Imperial Valley.

The Calexico Creamery Association made its first run last week; it has a capacity of 5,000 pounds daily.

Residents of the El Cajon Valley, San Diego County, are planning a celebration of "El Cajon Fruit Day."

The Coachella Valley has filed on 25,000 inches of the Colorado River.

Coachella Valley shipped its first okra last week, which sold for 40 cents per pound.

Many ornamental trees have been planted along the roadsides of the El Cajon Valley, San Diego County.

Deputy State Horticultural Commissioner Maskew is investigating work of ladybirds in the Imperial Valley.

The estimates of acreage planted to cotton in the Imperial Valley this season ranged from 20,000 to 30,000 acres.

Citrus growers are pleased because of the $25,000 appropriation for the Riverside Citrus Experiment Station.

Ventura is endeavoring to secure the establishment of a plant for the manufacture of California eucalyptus wood.

The first roasting ears of the season were brought into Los Angeles from Coachella Valley, in Riverside County.

Fillmore, Ventura County, is hoping for the establishment of a cannery; apricots will be the principal fruit handled.

An Imperial Valley farmer is having doubletrees sawed from three-year-old eucalyptus trees measuring six inches in diameter.

With the amount of Navels being reduced every day, Valencias are coming to their own, and will soon be going forward in train lots.

A Hemet orchardist has prevented attacks on his orchard by army worms by surrounding the entire orchard with furrows containing water.

The Southern California Sugar Company at Santa Ana is erecting a $100,000 beet pulp drier. The plant expects to start early in July, and will handle about 6,000 acres of beets.

County Horticultural Commissioner Beers of Santa Barbara reports that the setting of walnuts is very encouraging and that large arceage of young walnuts was planted during the past season.

One of the heaviest fruit trains ever sent east over the Santa Fe was on last Thursday, when fifty-two cars of oranges were pulled out by four engines of the Santa Fe's biggest type. There were more than 2,000 tons of fruit on the train.

Chairman Cuttle of the Reforestation Committee reports that he has a written statement from the forest service that it will set aside an amount equal to an appropriation of the State of California up to $10,000 for continuing the work of a fire protective system in California mountains.

The Coast

All grain at Rudy, Utah, has been planted.

Grays Harbor, Washington, has an Orpington hen which lays four-ounce eggs.

San Simon Valley, in Arizona, has developed a 400-gallon-a-minute artesian well.

Poultrymen at Everett, Washington, have fixed upon December 4-8 as next show dates.

Garfield, Washington, is becoming the center for the production of seed of field peas.

Potato growers at Puyallup, Washington, are now selling their holdover crop at $45 per ton.

The reclamation service has rejected all bids for work on the Lake Kachess dam project.

Alaska was visited by a hurricane and blizzard during the last of April which did much harm.

The Portland cattle market reached a point last week where seven cents was offered for hay-fed steers.

General rains over various sections of the Inland Empire last week proved of great benefit to the wheat crop.

Nearly 70 per cent of the wool of the United States is produced in what may be called Pacific Coast states.

A large bunch of horses intended for the Philippines failed to pass the inspector at Seattle, and all were rejected.

Cherry growers at Eugene, Oregon, have sold large quantities of cherries to the California Fruit Canners Association.

The poultry association of Asotin County, Washington, is preparing for a "comparison show." The date is not yet fixed.

The first wool sale at Pendleton, Oregon, was held last week, and three clips, amounting to about $100,000, were sold.

Yuma Valley alfalfa growers are selling hay in the stack at $8 to $10 per ton. The average for the past season has been $12 to $13 baled.

Many orchards of the Valley of the Yakima and Columbia Rivers are affected with a bud and leaf eating insect called the climbing cutworm.

Wool growers near Spokane, Washington, are elated over reduction in freight rates which gives promise for more prosperity to the wool grower.

All of the states of the Coast are taking alarm at the prevalence of the alfalfa leaf weevil which is doing so much damage in the alfalfa sections of Utah.

Farmers of Yuma Valley held a meeting at Yuma last week and discussed disposition of the hay crop; it is expected to perfect a marketing organization.

A contract has been signed by the Commercial Club of Bend, Oregon, which will secure for that city the Union Woolen Mills, and will call for the erection of a $250,000 mill.

The state veterinarian of Washington reports 150 outbreaks of contagious diseases among the farm animals of the state during the past year. Glanders and tuberculosis were the principal diseases.

Have you seen the Norwich Automatic Feeder and Exerciser?

Thousands have and are using them.

Agricultural Colleges endorse them. WHY?

Because you save 50% in labor, 25% in your feed bill and your egg production is increased 18%. Think of it. We guarantee all these claims. It costs you nothing to prove them. Send for printed matter.

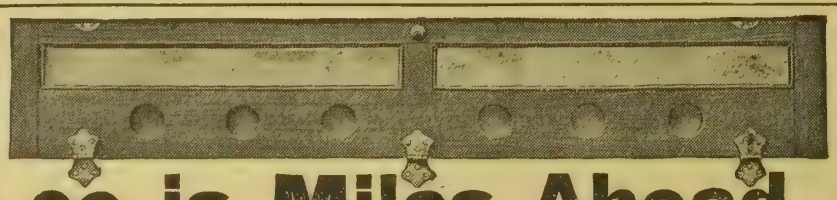
This open front door makes perfect ventilation



Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs.* Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

NEW OUTDOOR BROODER Heated—Storm-proof

Practical Poultry Culture

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

CANARIES.

By Mrs. A. Basley.

All my life I have loved canaries. The prettiest and dearest of "our little feathered brothers of the air." The wonder to me is that so few of them are kept and loved in California.

In England, in France, in Germany, and in most of the European countries, canaries are a source of income as well as of pleasure to the artisan or mechanic class. I have known personally shoemakers, plumbers, harness makers, carpenters, who were really expert canary breeders. I have myself patiently ground a little bird organ for hours day after day to teach the youngsters to whistle a certain tune, and at one time I took a number to the forest of Montmorency so that they could learn the nightingale song from the wild nightingales of the forest.

Canaries were brought to England about three hundred and fifty years ago from the Canary Islands. Since that time they have been extensively bred as household pets. During the three hundred and fifty years of its domestication the canary has been the subject of careful artificial selection, the result being the production of a bird differing widely in color of plumage and even in size and in form from the original wild bird.

In England, as well as in other countries, canary breeding is a hobby. There are hundreds of canary shows in England, and thousands of the lovely little pets are exhibited annually, but the climax show is at the Crystal Palace every February, when the champions from all over the country meet, and the judges have a hard time to select among so many almost perfect specimens the best canary in all England. The winner of each class in that Crystal Palace show means the choicest of ten to twenty thousand from over all England, Scotland, Wales, and even Ireland. The enthusiasm in England over these beautiful little pets is greater than in any other country, and it is not surprising, when one realizes that the expense of feeding a canary is next to nothing, and the care of them only a pleasure.

The price of canaries in England varies from one dollar to five hundred, for it all depends upon the beauty and the singing quality. In some places there are singing contests for some varieties. For show and singing and for general excellency the Norwich Canary carries the palm. It is the favorite breed in England. Understanding the judging of these little birds has become there quite an art, which we have yet to learn.

We now have among us an English judge and breeder of English Norwich Canaries, who later on will give the readers of the Cultivator a few hints on the breeding and rearing of canaries.

DUCK RAISING.

By Mrs. H. Byfield.

For a quarter of a century we have raised ducks in a small way. Our ducks, with the exception of a few culls, were always sold for breeding stock, so we know little of the profits when sold in the market. We dressed those that failed to attain a desirable shape and size, and they sold very readily for a fair price.

The amateur in duck raising may not be able to glean the few important facts from a neighbor, as might be done in the case of chickens. There are always amateurs, and for them I write, and very particularly for the woman whose start is a trio of ducks and a goods box she has wheedled out of the grocer.

Let me tell you those ducks stand for an added comfort in the home, but not if they have the range of the dooryard. A low fence will hold them, and their yard should be where water can be supplied from a hose. Lucky you are if you have a pasture of alfalfa fenced hog-tight, but even then a small yard in connection with a dry sleeping shed is necessary, for to make sure of getting the eggs the ducks must be confined until 9 a. m.

A low trough should be placed in this small yard and filled with fresh water daily. A convenient one is made by taking two planks four feet long and sixteen inches wide, or even twelve inches will do, and shaping like rockers at each end. Use these for the sides of the trough. Get a piece of galvanized iron about twenty-six inches wide for the bottom. For the ends use pieces of 2x4, the length your iron is wide. A trough like this is easily rocked back and forth to cleanse and empty. Ditches and streams upon which ducks may swim away are a drawback hard to overcome. We always fed our breeding stock a morning meal of cooked refuse, vegetables and bran. After the breeding season was over a bit of grain at night was all the feed given, as they lived in the pasture, and this was only given to insure their return at night.

Duck eggs may be set under hens or in incubators, but not under ducks, as they are poor setters; at least the Pekins are. Mammoth Pekins are all we know about. They require twenty-eight days for incubation, and care should be taken to have the eggs quite fresh. Duck eggs spoil quickly, and a week is long enough to keep them. If hatched under hens, great care must be taken to free them from lice. As good a way as any is the old-fashioned one of using a bit of lard on each little head and under the wings. Add a few drops of coal oil to the lard, and never grease the whole body. I have raised hundreds of ducklings without hen mothers or heated brooders. Very rarely we lost any, and I would certainly discourage the use of hen mothers. We usually managed to have from fifty to seventy-five come out at once, and a home was made for them by setting four boards on edge for a pen and using a shed-roofed box for sleeping. Sometimes, if the weather was cool, I gathered them into a box covered with an old blanket and set them in the back kitchen at night, until they were a week old.

Feeding and water play an important part in making a rapid gain in weight.

They are gross feeders, and if raised to twelve weeks in pens, plenty of green food should be furnished, as well as their regular mash, a mixture of bran, shorts, cornmeal, and a small percentage of sand. Several times a week ground meat should be added. In Nebraska, if grasshoppers threatened the welfare of my garden, the ducklings were turned in when three weeks of age, and the harm done the garden was small until tomatoes began to ripen. Their services were invaluable as insect destroyers. Water must be furnished ducklings in covered fountains until old enough to put in the pasture.

Duck feathers are another source of income, as they yield a quantity. After the breeding season is over, the breeders are picked every six weeks until cold weather begins. The early ducks also are picked, but not more than once, as it is desirable to keep them in good shape for selling.

We advertised our stock, and shipped breeders to many states. We also shipped eggs in their season. We have no ducks in California, but from what we have seen of the climate we believe anyone with an alfalfa pasture for them could put the Eastern duck raiser away in the shade. Ducks are hardy, and there need be no loss with the young. They are easily changed from one situation to another. A fence twenty-four inches high is really higher than necessary to confine them. The housing need cause no anxiety. The bodies make lovely roasts, and the feathers fat, soft pillows.

Exercise is very essential to keep breeding stock in the pink of condition. Breeding stock must not be too fat and must not be overfed. There should be a natural flow of eggs without using too much forcing in the production so as to weaken the vitality. Keep the breeding females busy scratching for grain in the litter. Those laying hens which are workers are usually the best parent stock. The drones are of no value and should be weeded out of the flock.

HOW TO PRODUCE GOOD MARKET EGGS.

By A. G. Phillips, Associate in Poultry Husbandry, Indiana Experiment Station.

There is a growing sentiment among some farmers and egg buyers of Indiana for the production of better eggs for the market. The buyers demand better eggs than they have been receiving and some farmers desire a better price for their good eggs. To produce these better eggs the farmer should have a thorough knowledge of conditions that may affect production. The egg is manufactured by the hen from the food that is consumed, hence her feeding should be carefully considered. No ration should be made up wholly of grain, but it should contain with the grain, a mixture of bran, shorts and beef scraps or skim milk. The grain should be fed in a deep litter to induce exercise. Green food of some kind, grit and oyster shell should always be handy for the fowls. The number of eggs produced will depend largely upon the breed used, the ration fed, the congeniality of surroundings and the care given. If any of these things mentioned be omitted, the number of eggs produced will be decreased. A male bird is not necessary for the production of eggs, hence should be removed from the flock at the end of each breeding season, in order to insure infertile eggs. Infertile eggs keep better and are very desirable upon the market.

Select Hens That Lay Large Eggs.

Farmers should look well to their flocks when considering the question of egg production, and select large hens of the breed which they keep, culling out and disposing of all undersized birds. By this means they will be able to obtain eggs of desirable size.

What the Market Demands.

All people do not agree on the definition of a good egg and even some do not realize the conditions that sometimes affect its quality. In order to meet any demand for first-class eggs, the eggs should weigh one and one-half pounds to the dozen, be uniform in size, naturally clean, not washed, strong shelled and fresh.

A fresh egg is one that was laid by a healthy hen, is only a few days old and has been kept in desirable surroundings. A fresh egg is not one that was allowed to stay in the nest for a day or two, until it became convenient to gather it, or was taken from a stolen nest, or an incubator, or from under a setting hen.

Conditions That Affect Eggs.

Age causes an egg to become stale and shrunken and it can never be classed as a fresh egg. Heat seriously affects the quality of eggs and in warm weather they should be gathered daily and marketed as often as possible. Moisture causes molds to develop and quickly changes the quality of the egg. Muddy weather means dirty nests, consequently dirty eggs. Nests built upon the walls of barns and hen houses are often used as roosting places, causing filth to accumulate, resulting in dirty eggs. Dirty eggs must be handled as second grades; washed eggs are just as bad. Eggs deteriorate in quality if they are left behind the kitchen stove or are stored in damp or musty cellars.

When to Market Eggs.

It is not desirable to keep eggs any length of time before marketing, although it sometimes becomes necessary to do so. When it becomes necessary to keep eggs, a cool, dry cellar should be used and the eggs kept in some receptacle, such as an egg case, that will prevent them becoming broken or stained. Such eggs should be marketed as soon as is possible. Only eggs that are properly handled can be accepted by egg buyers as first-class stock.

Water is the cheapest of all the supplies requisite to egg production, and is of the utmost importance, for it enters more largely into the composition of the egg than any other one ingredient, yet it is more often withheld than anything else. More failures in getting eggs are directly due to this neglect to supply the fowls with water, regularly, than to improper feeding.

P & O

CAMPBELL SUB-SURFACE PACKERS

We are the sole manufacturers of this famous Sub-Surface Packer, the only one made.

This is the one that you have heard everyone talking about.

Send for our Special Pamphlet on Sub-Surface Packing, the best known system for "dry farming," a method of absolutely insuring bumper crops with a minimum rainfall—the salvation of semi-arid regions.

Made in Three Sizes, with 10, 16 and 24 wheels, is heavy and strong, and the frame is made to carry all the extra weight required. Write for Catalog No. V

Parlin & Orendorff Co.,
CANTON, ILL.

DAISY FLY KILLER

placed anywhere, attracts and kills all flies. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, cannot spill or trip over, will not soil or injure anything. Guaranteed effective. Of all dealers or sent prepaid for 20 cents.

Wholesale Grocers — General Merchandise

We refer you to this paper as to our reliability.

California Likfresh Company

WM. H. SWETT, Pres.

Growers, Packers and Canners:

You cannot afford to continue drying by present methods, whether sun-drying or evaporating. You are under unnecessary expense—Your cured fruits and vegetables are costing you more than you need to pay.

Premium stock can be made by Likfreshing the fruit that reaches your cannery a little too ripe for successful handling with your present equipment.

The Likfresh process is not only less expensive, but it does the work in less time.

The advantages of Likfresh do not end with economy of production.

LIKFRESHED FRUITS AND VEGETABLES are not merely "dried". They are "like fresh", as the name indicates.

For example, Likfreshed peaches or apricots soaked in cold water, then eaten with sugar and cream, will taste as if just picked from the tree. Apple sauce made of Likfreshed apples, has the flavor, firmness, and appearance of sauce made from the fresh article. Likfreshed roasting ears, cabbage, string-beans, cauliflower, pumpkin, squash, rhubarb, strawberries, loganberries, raspberries, etc., will have the appearance, flavor and in every way resemble the fresh article when cooked.

This means higher prices for your cured products. Cheaper production and higher prices mean more profits for you.

Inquiries have been received from all over United States and Canada, asking for samples and information as to where the product can be bought in large quantities. The market is ready—it is time for you to make ready to supply the demand.

We install your plant for you ready to run. We build the first fire, test the machine and teach you to run it. In short, turn the plant over to you in perfect running order and under your control.

Every fruit man should see the Likfreshing machine in operation. You are invited to visit our demonstrating plant at Berkeley, bring something with you and watch it put through, bring as much as you like.

BUT BY ALL MEANS SEE IT, IT MAY MEAN A BIG SAVING TO YOU THIS SEASON.

For further information, samples of product, etc., address:

Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Soft Brown Scale.

I send prune branches affected with some disease. What is it, and how can I rid my trees of it? They are heavy with crop, and I wish to remove this disease if possible. I have sprayed with bluestone, sulphur, lime and water. This year, however, they were sprayed with distillate and water, as was suggested to me, but this seemed to do no good.—P. J. C., Parlier.

This "disease" is a good, healthy attack of soft brown scale. The healthiness, however, is largely on the part of the scale, and not the trees, or at least will not be in course of time. We would advise treating the trees with kerosene emulsion, though this could have been done more cheaply when trees were dormant and leaves on the ground, but where as badly infested as this we would not wait. See issue of November 3, 1910, for method of mixing wash. The distillate spray, if used of proper strength and thoroughly mixed with power sprayer, should have been sufficient to control the insect; the bluestone, of course, has no effect on animal life.

Renewing Blackberries.

Please inform me how long Mammoth blackberries should bear profitably. Mine are five years old, and have been heavily manured twice during that time. They stand near the ditch and look healthy, but the berries are small and pinched.—Subscriber, Visalia.

Profitable bearing age of blackberries varies according to soil and treatment; we presume yours have reached the limit and should be replaced. If the old stool has become so weak that the shoots are not large and strong, and the fruit, as you say, is small, we should uproot and fertilize the ground heavily, plowing deeply and establishing new plants. Eight years is usually considered the limit, and yours, having gone the five, may well be renewed. The best method of renewal is to have different rows planted succeeding years.

Bordeaux for Mildew.

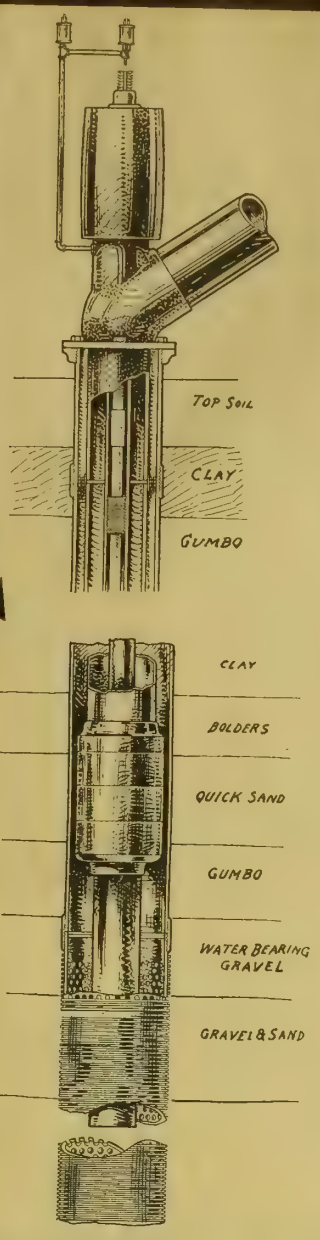
We were told on the demonstration train which passed through here some weeks ago that Bordeaux was worthless in prevention of mildew on grapes. We understand Mrs. Sherman claims that at a lesser expense she can control mildew with the Bordeaux. Which is right? It is too late for spraying this year, but would like views of vineyardists on this subject; they will be of value in next year's work.—H. B., Sanger.

We hope the suggestion of H. B. will be acted upon by our subscribers. Is not the Bordeaux usually sufficient? Mrs. Sherman's assertion seems amply proved by the fact that in twelve years she has had to use sulphur but twice. We are inclined to think the subscriber misunderstood the demonstration train instructor. The application of Bordeaux for this purpose is made when the vines are perfectly dormant and soon before their leaving out. In any case those which were not thoroughly treated this season, or application on which was followed by a rain, may well be sulphured.

Mortality of Incubator Chicks.

I hove lost quite a few chicks from one to two weeks old, and in holding postmortem I find that the yolk of the egg that is drawn into the chick during the last twenty-four hours of incubation has not been absorbed, which no doubt caused death. I did not incubate these chicks myself, so do not know anything about their incubation. In holding the postmortem I could not see where the yolk came in contact with any part of the digestive organs, and therefore I came to the conclusion that it is caused by faulty incubation,

(Continued on Page 627.)



The Pump Illustrated above is well adapted for all general artesian service. 11⅝ and larger in diameter.

Our New Catalogue is Ready

It contains valuable information. Don't fail to write or telephone for one.

Some of the Contents:

- Weir Table.
- How to Measure your Water Supply.
- How to Make a Weir.
- Horse-Power Belting Will Transmit.
- Relative Quantities of Water.
- Frictional Loss in Feet for 100 Feet Clean Iron Pipes.
- Diameter, Circumference and Area of Circles.
- Contents of Round Tanks in U. S. Gallons for Each Foot in Depth.
- Amount of Fuel Required for 12 Hours' Operation.
- Water Measures.
- Power to Drive Pumps.
- Some Useful Data in Hydraulics.
- Useful Information and Formulae for Calculating Pump Problems.
- Rule for Determining Size and Speed of Pulleys or Gears.

We guarantee every pump properly installed under our directions

Three Holstein Friesian Bulls, splendid young animals for sale, well marked and subject to registry. Write at once to Geo. G. Roeding, Fresno, Cal.

WANTED

Local Representative Wanted—Splendid income assured right man to act as our representative after learning our business thoroughly by mail. Former experience unnecessary. All we require is honesty, ability, ambition and willingness to learn a lucrative business. No soliciting or traveling. This is an exceptional opportunity for a man in your section to get into a big-paying business without capital and become independent for life. Write at once for full particulars. Address E. R. Marden, Pres. The National Co-Operative Real Estate Company, L 448 Marden Bldg., Washington, D. C.

Wanted—Your work pays the expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. United Trade School Contracting Company, 647 Pacific Electric Bldg., Los Angeles, Cal.

Wanted—Situation to keep ranch accounts by a competent bookkeeper. Address Thomas W. Ward, 520 15th St., Oakland, Cal.

MACHINERY

For Sale—Second-hand windmills, gasoline and steam engines, pumping outfits. Wagons, buggies, harness, disc, gang, walking, riding and side hill plowers; slip, Fresno and wheel scrapers; header, baler, seed sowers, spike tooth and disc harrow, mowers, rake, fanning mill, dry washer, disc cultivator, reaper, blower, anvil, eveners; road grader, road roller, Hurst two-horse sprayer, mining hoist, sundries.

WINDMILL OUTFITS.

12 ft. steel aermotor, tower, 10,000 gal. tank, tank stand, pump complete, $150 f. o. b.; also many others at half new price.

ENGINES.

2 H. P. R. & V. engine, jack and pump complete, $99 f. o. b.; also many other sizes.

TANKS, TANKS, TANKS.

50 gallons to 50,000. Special price on 30,000 gallon. 20 tanks, 500 to 1,000 gallons, $5 to $14; 38 tanks, 3,000 gallons each, cost $48.50 new, at $29 while they last. Why buy new material when we save you half and guarantee all material? Get others' prices; see us last. Demmitt Company, upstairs, 120 N. Main St., Los Angeles, Cal.

For Sale—Complete pumping plants, new and second-hand. Electric and gas engine driven. All sizes. Send us your details for our recommendations, irrigating appliances and pipe molds. We can save you money on your installations. H. U. Roeding & Co., Foxcroft Bldg., San Francisco, Cal.

Gas Engines—We have snaps in second-hand gas engines. Every machine guaranteed. Bailie & Brandt Co., 943-945 N. Main St., Los Angeles, Cal.

DAIRY SUPPLIES

Have You a Cow?—Have you a creamery? Have you a cheese factory? Write us. Everything used in either a dairy, creamery, cheese factory, or for handling milk, cream, butter, or cheese. We are in a position to quote you prices on entire creamery or cheese-making outfits. We make a specialty of only the latest and best sanitary machinery and supplies. Send us a list of what you want and we will quote prices which we feel certain will interest you. O. J. Weber Co., 225-227 East Sixth St., Los Angeles, Cal.

Milk Bottle Fillers, milk cans, cream separators, etc., at Guy F. Kelsey Co., supplies for the dairy, 108 E. 8th St., Los Angeles Phone Sunset Main 7496.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade, the live stock and poultry industries, are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

Agricultural Implements—Vehicles

Splendid values, lowest prices, liberal credit given by our retail department. See us without fail before buying. Catalogues mailed to out-of-town customers. A personal call will show you that we have the best and largest stock in the southwest. We are now doing the largest wholesale business and intend to build up our new retail department. Arnott & Co., established 1892, 112-118 South Los Angeles St., Los Angeles.

For Sale—One 5-passenger Winton auto, extra tires and inner tubes. Also one autocar runabout, fully equipped. M. Jacobs, 201 Howard St., San Francisco, Cal.

NURSERY STOCK

For Sale—Sour Orange Seed Bed Stock. Clean and thrifty, having excellent fibrous roots. $3.00 per hundred, $25.00 per thousand. We ship safely to all parts of the country. Armstrong Nurseries, Ontario, Cal.

Chayote, Chocho (Sechium Edule), the delicious, perennial, Mexican summer squash; large fruited, smooth skinned variety, introduced by Dr. Francheschi. One plant ripened more than 500 fruits last season. Strong, pot grown, $1 each. Montarioso Nursery, Santa Barbara, Cal.

DUCKS

For Sale—Mammoth Pekin and Indian Runner Duck eggs, No. 1 stock, 75c per 12; $5.00 per 100. White Plymouth Rock and S. C. Rhode Island Red eggs, $1.00 per 15; $5.00 per 100. Fine, vigorous, farm-raised breeding stock; eggs high in fertility. A. E. Nelson, El Monte, Cal.

TREES

For Sale—About 3000 each of Washington Navels and Valencias, 1 to 2 ft. high, at 35c each. Also several thousand each of Washington Navels and Valencias, 2 ft. high and upwards, branched, at 50c each. All the above are 1-yr.-old buds; guaranteed clean, healthy, vigorous trees. Carroll B. Smith, Box 9, Redlands, Cal.

One thousand one and two-two Eureka Lemons, two thousand two-year Valencias, sweet and sour orange seed bed trees, five hundred camphor trees. Southland Nurseries, F. H. Disbrow, Prop., R. D. 1, Pasadena.

Eucalyptus trees in any quantity from 6 inches up. Sweet orange seed and seed bed stock. Write for prices. Small's Seed and Plant Co., San Gabriel, Cal.

For Sale—Very cheap, 2000 choice navel or lemon trees, early 1912 delivery; care guaranteed. Half cash deposit required. O. E. Van Slyke, Glendora, Cal.

For Sale—A few hundred W. Navels of fine, vigorous stock from ¾ to 1 inch and 4½ to 5 ft. high. Nursery near Cypress Station on Santa Ana line. John L. Preston, Anaheim, Cal. Phone 1472.

For First-Class Valencia and Navel Orange trees and Eureka lemons, see A. G. Snow, Oxnard, Cal.

Fine line of Navels—Valencias and Eureka lemons for delivery spring of 1911. Contract now and get the first choice. The King Citrus Nurseries, Whittier, Cal.

Marsh Seedless Grapefruit—600 large trees for sale. E. S. Thacher, Nordhoff, Cal.

MISCELLANEOUS

It requires but 2 to 4 cents worth of the darkest and cheapest honey to make a gallon of the richest and most delicious beverage drink. It is a perfect substitute for fruit where fruit is scarce, and a perfect substitute for water where water is poor. A tablespoonful of evaporated milk in a glassful makes buttermilk that is worth twice as much as the natural kind. Process and right to use it two years 25 cents. C. W. Dayton, Chatsworth, Cal.

For Sale—A modern seven-room house and lot 160x150 adjoining Whittier College campus. Mrs. C. L. McCleery, 705 E. Philadelphia St., Whittier. Phone 152.

Imported Carneaux—The great squab pigeon. A limited number of mated pairs at $3.00 per pair. Chas. N. Taylor, Artesia, Cal.

For Sale—Pure Italian queen bees, untested, one $1, three $2.70, six $5, twelve $9.50; tested, one $1.50, three $4, six $7.50, twelve $11.25. W. A. Gilstrap, Ceres, Cal.

RARE PLANTS

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

Ahuacates, Alligator Pears (Persea Gratissima). Fresh Mexican seeds, none better for stock; $4.50 per 100 seeds; $40.00 per 1000 seeds. Montarioso Nursery, Box 1500, Santa Barbara, Cal.

Ferns for growing on Adiantum pedatum 5c, Pteris serrulata 3c, Aspidium tsusimense 3½c and 5c. Terms cash. Ballou's Nurserv. Pasadena. Cal.

TURKEYS.

White Holland Turkey eggs and poults. Two pens headed by magnificent, heavy toms, correctly mated with beautiful hens. Eggs $3.50 per setting. Bronze Turkey eggs $2.50 per setting. Poults 50c. Richard Eble, Casa Verdugo, Cal. Sunset Glendale 164 J Rhode Island Red and White Leghorn eggs and baby chicks.

White Holland Turkey Eggs from extra large vigorous stock, 35c each. Gobblers $7. Poults June 2nd 60c each, hen-hatched from my own stock only. Mrs. Hocking, Guasti, San Bernardino County, Cal. Winner of first prize Los Angeles 1911.

Mammoth White Holland Turkey Eggs, $5.00 per 13. No better stock anywhere. A. H. Blakely, Ontario, Cal.

POULTRY

This is My Last Notice for the Season. Those who desire eggs from either "Kellerstrass" White Orpingtons or Buff Wyandottes should write at once and book orders. Orpington eggs 20c each, Wyandotte 10c straight. Good stock. Satisfaction guaranteed. Frank Haasis, Ontario, Cal.

R. I. Reds—Much time may be saved in producing heavy layers by buying eggs from a breeder who has established a record by specializing in heavy laying stock. Eggs, hundred $5.00, finely pointed; 15, $3.00. "The Luedkes," Anaheim, Route 1.

Settings from splendid strains White and Buff Wyandottes. Prices reduced for months of May and June W. C. Parker, 113 Pacific Ave., Santa Cruz, Cal.

Orland Hatchery—White Leghorn chix, $8.50 per 100. $80.00 per 1,000. Brown Leghorn chix, $8.50 per 100. P. L. Simpson, Orland, Cal.

Kellerstrass White Orpington Eggs, $2.00 per 15; $12 per 100. R. L. Warren, National City, Cal. R. F. D. 1.

POULTRY

Lasher's Hatchery, 15 Kent St., Petaluma, Cal.—Why my chicks live and grow in the hands of my customers. They are all hatched from free range stock, bred right, mated right, fed right. I have the most up-to-date hatchery building in the country, built of brick, with dead-air space in wall, giving me a uniform heat that means strong, healthy chicks; 16 years in the hatching business, 10 years at present stand. It is no experiment or guesswork with me. Prices per 100, White Leghorn, from general flock, $7.25; special matings, $8.50. Leghorn cross, $7.25. Black Minorcas, $10. Barred Plymouth Rocks, $15. Terms, cash with order.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

White Orpington and White Wyandotte eggs for hatching. My winnings at Los Angeles 1911 were 1st cock, 1st hen, 1st and 2nd cockerel and 1st pullet on White Wyandottes. White Orpingtons, 1st, 3rd, 4th and 5th pullets, and 2nd and 4th hens. Eggs sell at $3.00, $5.00 and $10.00 per 15. Order direct from this ad and your order will receive my most careful attention. A. W. Huskins, 713 Waterloo St., Los Angeles, Cal.

The Goodacre Strains—Just the time to get our Quality Reds, our special offer on eggs from choice matings of $3.00 per 15 or $5.00 per 30 is hard to equal; our commercial day-old chicks we now offer in 100 lots at $12.00; our Reds have been constant winners the past three years in our Coast shows. We can sell you choice eggs, Buff Orpingtons, Anconas and White Runner Ducks. Write us today. Goodacre Bros., Compton, Cal.

Hayes, R. B., Poultry Fancier and Rhode Island Red Specialist—30 breeding pens of Reds, 20 pens miscellaneous varieties. See our birds, they tell their own story, or write for circular. Eggs for sale only. Yards in Arroyo, opposite Ostrich Farm. Box 35, Garvanza Sta., Los Angeles, Cal. Phone East 1631.

Eggs $1.00, 15; $5.00 per 100. Chicks $15.00 per 100, $12.50 for incubator lots. R. I. Reds, Barred Plymouth Rocks and B. Orpingtons. A few B. Orpington pullets for sale. Cash with order or stamped envelope for reply. L. W. Neilsen, R. R. 2, Box 1 A, Petaluma, Cal.

Baby Chicks from my pure-bred stock S. C. White Leghorns, carefully selected for laying and standard qualities. $9.00 per 100, $85.00 per 1000. Eggs for hatching $5.00 per 100. Correspondence solicited. J. R. Heinrich Poultry Yards, Arroyo Grande, Cal.

BONNELL'S S. C. BLACK MINORCAS
WIN EVERY TIME
At Los Angeles Show, 1911, every first premium and three silver cups; 2 specials for best male and female. Eggs at $5 and $3 per setting. C. C. Bonnell, 2919 Brighton Ave., Los Angeles.

Baby Chicks from thoroughbred White Leghorns, "bred to lay," not simply chicks, but "Stock," the kind that breed true to color and fill the egg basket; May and June, $8.50 per 100; safe delivery insured. F. W. Dobbel, Buena Vista Poultry Yards, R. F. D. No. 1, Sonoma, Cal.

The White Wyandotte Farm — Eggs for hatching $1 per 15, or $6 per 100 in incubator lots. Day-old chicks $2.40 per dozen, or $15 per 100. Farm at Vista del Valle, on Covina line. P. O. address, Baldwin Park, Cal. C. M. Thompson.

Barred Plymouth Rock and Black Langshan eggs, $1.00 per 15; $5.00 per 100. Langshan cockerels, $2.00 each. Mrs. J. W. Greene. Waukena, Tulare Co., Cal.

Rose and Single Comb R. I. Reds. Rose Comb a specialty. Eggs for hatching from stock winning each year at shows. Send for mating list. W. H. Pickering, 984 E. 55 St., Los Angeles. Cal.

Rhode Island Reds—Eggs for hatching from high grade stock. Also some very choice cockerels, cheap considering quality. Write for prices. Frank Greenleaf, Greenleaf St., Santa Ana, Cal.

Day-Old Chicks and Eggs Only—Barred Rock; good laying strain. The Fairmount Hatchery, 29B, Rural No. 1, Santa Cruz, Cal.

Hicks Jubilee Hatchery, now booking orders. Write us your wants. We use eggs from first-class stock only. Try us. W. J. Hicks, Petaluma, Cal.

Mammoth Pekin Duck Eggs, $1.00 per dozen, $6 per 100, Select White Leghorn eggs, $3.50 per 100. Clough, 3826 Peralta Ave., Dimond, Fruitvale P. O., Cal.

Baby Chicks Every Week—Eggs for hatching. Large, vigorous, heavy laying strains. S. C. White Leghorns, Barred Rocks. D. S. Willey, Inglewood, Cal.

White Minorcas (Exclusively)—Eggs for hatching from first-class pure bred stock. L. V Peterson. Guerneville. Cal.

Barred Plymouth Rocks—The kind that "Win and Lay." Eggs and stock for sale. C. H. Vodden, Los Gatos. Cal.

For Sale—Rhode Island Reds, mature stock, chickens a bargain to one taking the entire lot. Mrs. C. L. McCleery, 705 E. Philadelphia St., Whittier, Cal. Phone 152.

French Houdan Eggs $1.50 per 15, $4.50 per 50. Pen headed by prize winner. Mrs. Hocking, Guasti, San Bernardino County, Cal.

For Sale—Day-old chicks. Rhode Island Reds, 12½c, and Barred Rocks, good stock. S. Stone. Moneta, Cal.

For Sale—150 Purebred Barred Plymouth Rock hens, 15 months old, and 15 roosters. S. Malnick, Gossage Ave., Petaluma, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately Allaway & Layton Co., 607 E. 3d St., Los Angeles, Cal.

FARM LANDS FOR SALE.

An Exceptional Opportunity to secure at a bargain, an ideal apple orchard, located in the best apple section of the world's greatest apple district—Pajaro Valley, Santa Cruz County, California.

The property consists of 51.85 acres. Number of trees, 3784. Number of bearing trees, 3601. Age of trees, 7 to 10 years. Varieties: Belleflowers, 926; Newtons, 1140; Spitzenbergs, 1219; Missouri Pippins, 203; Baldwins, 132; other varieties, 164.

Dwelling house, 4 rooms and storeroom, 3 porches. Packing house, first story 55x70, second story 38x70. Blacksmith shop, barn and wagon house; main building 25x40, shed 18x40. Chicken house 12x30, and small house. Cement tank for water, 6000 gals. Water piped to dwelling, chicken house and barn.

Personal property: Two horses, 2 sets harness, 1 heavy and 1 light orchard truck, 1 wagon sled, 1 spring sled, 1 gasoline engine, Bean pump and 150 feet spray hose, 1 wheel cultivator 2 side-hill plows, 1 drag harrow, 1 1000-gal. tank, windmill and pump. 2000 tree props, 150 cull boxes, 6 ladders, 25 chickens. Dec. 1st, 8 tons hay, forge, blower, tongs, pinchers and other tools Some pieces household furniture.

1910 crop 10,500 loose boxes—4450 Belleflowers, 2833 Newtons, 1711 Spitzenbergs, 1456 other varieties. Estimated crop for 1911, 20,000 boxes, or about 300 tons. Buyers now offering $25 per ton orchard run. Crop goes with place if sold before July 1st, 1911

This property is located about seven miles from Watsonville, only five minutes' walk to Corralitos Postoffice and splendid school. Soil: Santa Cruz loam and Pajaro sandy loam. No irrigation, no freezing, no burning. Ideal California climate. Price $17,500. One-half cash. Adjoining properties in same class are held at $500 an acre. For further details and list of 50 orchard bargains write at once to Watsonville Farm & Forest Realty Co., 320 Main St., Watsonville, Cal. Reference: Pajaro Valley National Bank.

40 Acres, near Dinuba, Tulare County, ¼ mile from Southern Pacific, 3 miles from Santa Fe, within 3 miles of three towns; all dry. Accredited high school, telephone, rural delivery. First-class soil, level and under irrigation in best and cheapest irrigation district in this state. Water right with land. Produced 14 tons dried peaches and 25 tons raisins in 1910. 2 acres variety fruits and nuts, over 100 varieties. 2 acres pasture. Plastered cottage, large tank house with 3 finished rooms. Excellent water piped to house and barn. Work shop, fruit, poultry and wood houses. Fully equipped for fruit drying with trays, boxes, transfer fruit car and steel track throughout. Everything about place in first-class shape. $1500 worth personal property. Everything goes with ranch, including furniture. Price $14,000. For terms address owner, Chas. F. Collins, Dinuba, Cal.

A Eucalyptus Snap—70 acres ideal sandy loam soil; 60 acres now planted to Eucalyptus; 30 acres 2 years old; 30 acres planted this year; 8 acres in full bearing Apples; 2 acres in Apricots. Net income last year $568; this year's fruit crop will bring $800. This will increase in value $50 per acre yearly. The bare land is worth the money asked. Price $8500. Write at once to Farm & Forest Realty Co., Bank Block, Watsonville, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale or Trade—230 acres Oregon land in the famous "Rogue River Valley;" fine fruit land, 40 acres cleared, balance in timber; located ten miles from Central Point. A good two-story farm house, large barn. Fenced with 17-wire "Page Fence." Schoolhouse on corner. Would exchange for Los Angeles country or city property, to value of $8,000 or $10,000. Price $65 per acre. Address J. H. Grace, Central Point, Ore. P. O. Box 203.

200 Acres Good Level Land—13 A. orchard; shade trees; 12-room house; 2 barns; windmill and tank house; fruit houses; cream separator; engine; etc. Price $21,000.

12 A. orchard home, good house, 4 rooms and bath, barn, fruit houses, windmill, equipment; complete place. $3600.

Yolo & Solano Counties. Wyatt & Wilson, Winters, Cal.

Another Bargain—80 acres of fine level land, sandy loam, no hardpan or alkali. Altitude 2500 ft. Very healthy. Will grow anything; no irrigation required. See the crops growing here in Santa Barbara Co. Owner needs money, so $20 per acre takes it; ½ cash, balance 3 yrs., 10 per cent. No trades. Wm. Mantz, Maricopa, Cal.

For Sale—One of the oldest and best orange groves in the Redlands Junction section. 10 acres, house, barn and outbuildings. This grove is a heavy producer and is a snap at $20,000. Only $5,000 cash, balance mortgage on place for a long time. John W. Shepardson, 215 Katz Building, San Bernardino, California.

For Sale or Trade—Five acres of land in Greenfield, under irrigation. Set to alfalfa and family orchard. Small buildings and well on place. Will exchange for other land, good cows or mares. Price $750.00. M. A Sloan, Greenfield, Cal.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

For Sale—Fine alfalfa ranch. 86 acres. Owner is hard up and must sacrifice. Only $300 per acre. $10,000 cash is all that is needed to handle this. Near Corona, half mile from railroad station. Abundance of cheap water. John W. Shepardson, 215 Katz Building, San Bernardino, Cal.

For Sale—Ten-Acre Poultry Ranch, fully equipped for 1,000 laying hens. 450 laying hens and 450 small chicks on place, all S. C. White Leghorns. Call on or address R. A. Claus, Greenfield, Cal.

For sale—80 acres of land, four miles south of Hanford in the heart of the dairy belt, nearly all in alfalfa. Good buildings, fences and water rights. All checked and leveled. Telephone and rural mail delivery. Address Frank McClellan, Hanford, Cal.

Pacific Coast Lands—Farm lands appraised for prospective investors. Reports on agricultural projects, soils, irrigation, drainage, etc. Paul Goodloe, 1049 Phelan Bldg., San Francisco, Cal.

FARM LANDS FOR SALE.

Eighty acres finest eucalyptus land, 4 miles from Santa Maria, Santa Barbara County, about one mile from railroad; price $2000, if sold at once. A. Frederiksen, Arroyo Grande, Cal.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—5 acres, joining Roeding Park, Fresno. Address Mrs. Florence L. Bollinger, Fresno, Cal., General Delivery.

FARM LANDS WANTED.

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property Free. American Investment Association, 12 Palace Bldg., Minneapolis, Minn.

Fertile eggs for hatching. Choice varieties. White Rocks, White Wyandottes and White Orpingtons at $1.50 to $4.00 per setting; $6.50 to $10.00 a hundred. Ducks—White Muscovy, Dark Muscovy, White Indian Runner, White Pekin, Buff and White Orpington, $1.00 to $3.00 a setting; $5.00 to $12.00 per hundred. Send for Circular. Pheasants' eggs in season.

WICK'S WHITE FOWL FARM, Moorpark, Cal

CARNEAUX IN CALIFORNIA

Carneaux and Plymouth Rock Homer Pigeons, guaranteed thoroughbred and mated. The largest breeding plant on the Coast. Satisfaction guaranteed. Postoffice Box 355, San Pedro, Cal.

QUERIES.

(Continued from Page 625.)

and am writing you as I want to right myself on this point for my own future work.—O. C. S., Pasadena.

There are several different causes for the yolk of the egg not being absorbed. You are entirely right in supposing that the non-absorption of the yolk is the cause of the death of your chicks. I have studied this subject long and earnestly, and the conclusions that I came to are that the reason the yolk is not absorbed or digested is because either the little bowels have been overheated or chillled just before or soon after exclusion, and that this overheating or chilling has so weakened the bowels that the yolk remains in the bowel cavity and there putrefies, and the chick dies of blood poisoning. Sometimes, if the chick has been several days hatched and most of the egg has been assimilated, the chick hatched from vigorous parents will only have a little diarrhoea or be "stuck up behind," and will recover from the attack, although he will probably not be as large and sturdy as if he had never gone through this illness. There is also another thing that prevents the yolk from being absorbed, and that is feeding the chick too early in life, feeding it before the yolk has had time to be absorbed. This draws the gastric juice to the crop and leaves the yolk, and it then takes as much as ten or twelve days to digest, and before that time begins to go bad. For that reason we are told not to feed the chicks till they are about two days old. This is nature's plan. The nearer we can copy nature in raising the babies, the better will be our success.—A. B.

Brown Spots on Fig Leaves.

Referring again to question as to brown spots on fig leaves, Mr. C. O. Smith, of the Southern California Pathological Laboratory, after examination of fresh leaves, says: "The trouble with the trees is one quite similar to what we are finding to be present in other localities in the state on fruit and nut trees. It is due without question to the long dry season of last year. We would advise irrigating liberally if the trees seem to require it, and possibly fertilizing the trees to start out vigorous new growth. I am observing the blackish spots on leaves, but cannot find they are diseased with fungus or other organisms."

White Scale.

I send box with scale or insect which is infesting my young orange trees. What are they, and how may I eradicate them?—R. C. H., Anaheim.

This is the cottony cushion or white scale, more properly icerya purchasi. It is easily controlled by distillate or whale oil soap spray, or still better by fumigation. Without question, if you will write to the State Horticultural Commissioner, Sacramento, and ask for a colony of vedalia, it will be supplied, and that will probably be sufficient. This little predaceous insect has always proven abundantly able to cope with the pest.

Fumigation vs. Scutellista.

I am not long a resident of the state, but I have acquired two things I value since I came, viz., a subscription to the California Cultivator, and an orange grove of ten acres. I like the Cultivator first-rate and as a mark of faith I write for advice. An agent for a fumigating company called on me this week to sign up for fumigating next fall. I have been planning to send for some scutellista to turn loose in the orchard, but cannot get the address where to apply for them. I have some scale in my orchard, but I have to hunt to find many, and think from what I have learned that the scutellista would clean them out.—J. A. S., Covina.

We do not think that we would depend upon the scutellista or any other insect to control scale in the orchard unless it be the vedalia to control white scale. This little worker has fully made good, as has the scutellista in many cases. The investment in an orchard and the cost of irrigation, cultivation, taxes, etc., is so great that an orchardist cannot afford to experiment or to wait for slow action on the part of our insect friends. If there are pepper trees adjoining or near the place, they might well be colonized in order to establish a good colony. Colonies may be had by addressing State Horticultural Commissioner, Sacramento.

Chuckawalla Valley.

Please give me information regarding lands in Chuckawalla Valley and Palo Verde in eastern Riverside County. Can a man with small amount of capital make a living there? Is the soil good, and how is the climate? Is there much rain? How deep to water?—Subscriber, Burbank.

The Chuckawalla Valley is not yet far enough advanced for any definite information regarding it. As to soil we believe it is all right, a deep silt loam prevailing over most of the lands. The climate is very much like that of Imperial so far as anyone can tell, though there have never been continued observations. There are a few wells in the valley, but so far as we have learned not with sufficient water to be used for irrigation; some give only salt water. Water for irrigation is planned ultimately to be delivered by the Chuckawalla Development Company which is now about to construct a dam in the Colorado River. The Palo Verde Valley, a few miles east of the Chuckawalla is already partly supplied with water and other conditions are practically the same, excepting that the soil is heavier than in Chuckawalla. Both sections need a railway to give outlet for their products before any great prosperity can come to them. Ultimately both, we believe, will be sections of great wealth.

Three Queens in Small Hive.

My hives are 12 by 20 with six frames each. What time of the year can I take honey and how much from these hives? Do three queens ever bunch together in one swarm? I had three bunches of bees hanging on different trees and after two or three hours they all went together and I put them in one hive. The following morning they came out. Was it possible there was more than one swarm and was the hive too small?—M. E. M., Santa Ana.

This question was referred to Mr. Albert Dodge of Pasadena, and he answers:

"You may look for honey being gathered by your bees in your locality during this month and next. The quantity depends so much on the condition the colonies are in that no estimate can be made. Your hives are too small, but if you give them plenty of comb in upper stories, and do not limit the room for brood rearing too much, you should get a fair quantity of honey, otherwise you are apt to be troubled with excessive swarming and consequent loss in the honey crop. During the swarming season frequently two or three or even more swarms will come out at the same time, each from a different hive and unite in the air. If hived together they may not stay in the new hive. Where possible the queens should be separated and placed in separate hives, and the cluster of bees divided and apportioned among those hives with the queens. By putting a frame of brood with eggs in the cells in each hive it will not only help hold the bees in the hive, but should you fail to get the queen in the hive, the bees will proceed to raise a new queen from the eggs in the comb. It is possible that the swarm you speak of was so large the bees would not remain in such small quarters as you provided for them, even though there was but one swarm, and it came from a small hive. Your hive should be not less than 14 by 20, and 16 by 20 is preferred by most beekeepers.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Potash on Orange Trees.

How much potash can safely be applied to seven and eight-year old orange trees? I wish to apply it for the purpose of hardening wood and smoothing up fruit? What form of potash is best to apply?—Subscriber, Glendora.

The subscriber asks a question which, like many others which come to this office, is impossible to answer with much satisfaction. Intelligent fertilization must be founded on some knowledge of soil and sub-soil, mechanical and chemical conditions and former treatment. However, this question was referred to Dr. Chas. B. Lipman and he gives some valuable general information as follows:

I cannot reply directly to the question which your correspondent asks, because I do not believe that any experimental work has been done which casts the least light on the effect of potash on "the hardening of the wood and the smoothing up of the fruit," to quote from your own letter. That being the case, I can see no necessity, nor can I see the wisdom of random application of potash fertilizers in trying to attain objects which they have not the power, so far as we know at the present time, to bring about. Moreover, if I had evidence of a lack of potash in the soil of your questioner for normal plant development, I should say that he might attain the objects which he has in view, because an abnormal plant will not have the power to produce a hard wood and a smooth fruit, but that I do not know, and, further, I have no information as to the mechanical condition of the soil in question, nor as to the other chemical constituents, especially plant food ingredients, which may be present there. If I knew how these matters stood with respect to that soil, and how it had been plowed and cultivated, how irrigated and fertilized, whether or not cover crops were used, whether or not liming was at all practiced, I think that I should be able more readily to give some intelligent reply to your question.

You ask another question with reference to the best form in which to secure potash, which either for your purpose or the case in question, I am glad to reply to, and that is that I believe the sulphate of potash is the best form of potash fertilizer to use: First, because it is a high grade product with a high percentage of potash, and therefore necessitates less filler and less freight on filler; and, secondly, because it does not seem to have any harmful effects on certain plants, as does the chloride of potash, commonly known as muriate of potash, which in every other way may be as high grade a fertilizer.

I might add one word more with reference to the matter above discussed, and that is that our information at the present time with reference to the definite functions of potash in plant nutrition, our information with reference to the same material and its relation to its natural supply in our soils, our information with reference to the biological effects of potash fertilizers in soils, and finally on the mechanical condition of soils, is so slight and in such confused condition, that I believe no one is justified in drawing hasty conclusions from random experiments carried out by growers in an unsystematic way.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.
